The illustration shows the installation of the famous "Star" Ventilator on the War Trade Board Building, Washington, D. C.

## "STAR" VENTILATOR (Patented)

The "Star" Ventilator was adopted by the U. S. Government as its War Standard for cantonments and other important buildings, on account of its **HIGH EFFICIENCY** and **SIMPLICITY**.

The Thousands of "Star" Ventilators in use on public buildings, schoolhouses, mills, warehouses, and similar structures throughout the country, proves their superiority over other types.

We also manufacture Evans "ALMETL" Fire Doors and Shutters, Metal Tiles and Shingles, approved by the U. S. Gov., and High Grade Roofing Tin.

### An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

### ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates. Lawn Fences. Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

## As The Editor Sees It

As the Own Your Home Movement is spreading from city to city, financing the prospective home owner continues to be one of the chief obstacles to the movement, conventional banking practices in loan making and present restrictions on building and loan associations preclude the possibility that these regular sources of capital will meet the increased demands for home loans. If home-owning is to be made possible to an ever-widening circle of the population, in the opinion of experts who are studying the situation for Information and Education Service of the Department of Labor, new machinery must be devised for financing and this new machinery must provide for long time loans, at low interest rates, made on an amortization plan. Also, it is imperative that substantial and artistic dwellings are made available at the very minimum construction costs.

The dispatch shown by private interests in breaking from the profit-making conventions in this field, doubtless, will determine the future attitude of the Government. If private initiative does not discover a way to permit the realization of the home-owning aspirations of the people, it seems inevitable that the Government in some fashion must step into the field.

The Canadian Government already has passed the legislation enabling the Dominion Government to loan to the Ontario Government the money essential to certain housing operations. The Ontario Government, in turn, is prepared to make

loans to municipalities and companies incorporated under the Housing Accommodations Act, for acquiring lands and constructing houses for returning soldiers, working men and women and those of limited means who, without aid on exceptionally advantageous terms, would be unable to own their homes.

In the Canadian scheme the type of house must not exceed \$2,500 in construction costs and the maximum cost of each house and real estate is not to exceed \$3,000.

The municipality supervises the laying out of land, the plans for the dwelling, form of construction etc. The loans are for not more than 20 years and at 5 per cent. Where municipalities acquire land and construct houses they—the cities—may borrow from the Government fund the full amount required for this development and building. A housing company, complying with the law, may borrow up to 85 per cent. of the value of land and buildings. A loan may be made to a farmer and to persons who own their land and erect thereon a house for their own occupancy, to the full value of the buildings. Loans are made by the Province Government to the municipalities on progress estimates as required. The monthly payments for 20 years to cover interest and repayment of principal, on a \$3,000 property, will be about \$20, but the whole or any part of the principal may be repaid at any time during the 20 year period. The person buying covenants to repair and to pay

the taxes and insurance. A person may sell his interest in a property at any time.

In the United States the meeting of the finance problem remains in the hands of private interests and Own Your Own Home committees in various cities are meeting the problem in various ways. In Spokane, Wash., for the most part, the conventional methods of handling building loans prevail. The financing is worked out by the seller and building contractor. Some lot owners are willing to build to suit the purchaser if the latter pays down 20 to 25 per cent. of the purchase price and the balance in monthly payments over 3 to 5 years at 7 per cent. When 50 per cent. of the purchase price has been paid, the buyer can obtain loan accommodations on more favorable conditions from the mortgage companies and building and loan associations. In the Spokane campaign especial care is taken not to permit a person to buy beyond his possibilities of payment.

In St. Paul, Minn., an effort is being made to organize a Civic Home Loan Corporation with a capital stock of \$250,000. It is proposed to lend to prospective home owners and builders up to 85 per cent. of the investment on the contract basis, at 6 per cent. on deferred payments and with the elimination of discounting second mortgages and commissions.

Salt Lake City is depending on the "mutual" building society and the building and loan association. In discussing

the building society method of financing home builders, Nephi L. Morris, Vice-Chairman of the Employment Committee of the Utah State Council of Defense, says:

"The building society of which the writer is President is now in its twelfth year and sees greater opportunity for enlarging its scope and liberalizing its methods. We have an organized capital of \$200,000, of fully paid up stock upon which we guarantee a 6 per cent. quarterly dividend. Such an attractive investment as this is also over-subscribed. We are now authorizing the issuance of a 6 per cent. non-participating installment stock which stimulates saving, and we hope to get many men into the habit. The regular installment stock, representing the third series, receives an annual dividend of about 7 or 8 per cent. and participates in accumulated surplus when the series matures and realizes about 9 per cent. to the subscriber. This stock is sold only to borrowers; series No. 2 will be retired and series No. 3 subscribed for by the man who, because of his savings, becomes ready to build. This is the best possible plan of financing builders that we know anything of and several of the local real estate and building companies negotiate their contracts with a provision allowing the company to transfer the obligation to one of these building societies after the second or third year."

The tentative plans for financing construction of houses for shipworkers in Portland, Oregon, suggest a line of action adaptable to almost any community. In submitting to the Department of Labor the plans for proposed Portland Housing Corporation, Paul C. Murphy, prominent in the Own-Your-Own-Home Movement, says:

"We find in Portland that there are many persons who own their lot but cannot borrow sufficient money to build a home, as most of the loan companies will not lend over 50 per cent. of the value of the property. This plan is intended to provide for the difference between the amount that can be borrowed on a first mortgage and the amount necessary to complete the home. The monthly payments—which one would have to pay out for rent—would first apply to the second mortgage which, in most cases, would be paid off by the time the first mortgage became due, which could be renewed or put upon a monthly installment loan, like the building and loan association."

The proposed Portland Housing Corporation would have a paid up capital of \$10,000; it would prepare plans for houses to cost approximately \$2,000, designating the materials required and obtaining written assurance from material

men to furnish the complete bill of material on order at specified prices.

The Corporation would then invite applications from workers for assistance in building houses. These applications should show (1) bona fide employee for the three months preceding the application; (2) ownership of lot containing at least 5,000 square feet in a district acceptable to the Corporation; (3) cash in hand amounting to \$300 at least; (4) that the applicant is willing to enter into a contract with the contractor approved by the Corporation for the building of a house on plans likewise approved by the Corporation.

If application is approved by the Housing Corporation a contract is made between the applicant and a contractor for construction of a house at an approved price which, for illustration, is assumed to be \$2,000. The contract will provide for a payment of \$300 in cash, the execution to the contractor by applicant of his note and a first mortgage for \$1,000, also the execution in favor of the contractor by applicant of his note and a second mortgage for \$700. The first mortgage will draw interest at the rate of 7 per cent. and the second mortgage at the rate of 5 per cent. Interest rates in Portland are somewhat higher than in the East. The first mortgage will be payable in five years and the second mortgage at the rate of \$15 per month. Interest will be adjusted on both mortgages according to progress and completion of construction. As further security to the second mortgage holder the fee of property shall rest in a Trust Company as trustee until the second mortgage is paid. On the signing of the contract the Housing Corporation will procure a firm offer, from responsible persons to purchase such first mortgage at par when the house is completed and a similar offer for the purchase of the second mortgage. Consideration should be given to the alternative of placing these mortgages separately with individuals, or placing them with a corporation organized for the purpose.

At the annual convention of the American Institute of Architects, held at Nashville, Tenn., the following officers were elected: Thomas R. Kimball, Omaha, Neb., President; Charles A. Favrot, New Orleans, La., First Vice-President; Clarence C. Zantlinger, Second Vice-President; Edwin H. Hewitt, Minneapolis, Minn., William B. Ittner, St. Louis, and Henry H. Kendall, Boston, Directors.

E. Perot Bissell, of the firm of Bissell & Sinkler, Philadelphia, architects, was honored by the convention by being elected a fellow of the institute.

\* \* \*

The Philadelphia T-Square Club held its annual meeting at the clubhouse, 204 South

Quince street, Wednesday, May 7. The following were elected officers for one year: President, Nicola D'Ascenzo; Vice-President, Herman L. Duhring, Jr.; Treasurer, M. Edmunds Dunlap; Secretary, R. J. Wadsworth, Director, E. A. Yeo. Joseph Pennell, Paul B. Cret and John McLure Hamilton were elected honorary members.

\* \* \*

The efforts of the committee of the Advisory Board of the Master Builders' Exchange, in conjunction with that of the Allied Building Trades, to adjust a scale of wages mutually satisfactory, has up to the present time resulted in the adoption of the following scale for the different branches:

|                          | Cents. |
|--------------------------|--------|
| Stone masons .....       | 80     |
| Bricklayers .....        | 80     |
| Painters .....           | 75     |
| Plasterers .....         | 80     |
| Sheet metal workers..... | 75     |
| Soft stonecutters .....  | 82½    |
| Granite workers .....    | 80     |
| Carpenters .....         | 80     |

and under the following conditions:

Eight hours a day except Saturday, which will be four hours, making a total of forty-four hours as a full week's working time. For all time over and above the regular hour for quitting, 4.30 o'clock and up to 6 o'clock, one and one-half times the above rate. If time of work is continued from 4.30 o'clock after and beyond 6 o'clock, double time will be allowed.

As the above enumerated branches have been able within a week's time to determine upon this basis, it is quite probable that the remaining trades, which are now receiving attention, will reach a satisfactory adjustment within two weeks' time.

#### PERSONAL NOTES

The Mackle-McClelland Construction Company, engineering and building construction, have opened offices in the Drexel Building, Philadelphia. David A. McClelland, well known builder in Philadelphia and vicinity for the past twenty years, is president of the company. James Shepherd, chief engineer of the Mackle Construction Company, Atlanta, Georgia, is vice president, and Francis E. Mackle, president of the Mackle Construction Company, secretary and treasurer.

Mr. Mackle has been engaged in the construction business in Atlanta for the past ten years, going there from Boston, Mass. His company is one of the best known in the South, having executed important contracts aggregating many millions of dollars and including every type of building from residences to some of the largest office buildings and apartments in the South. During the period of the war, his company has successfully completed over \$3,000,000 worth of work for the Government.

Mr. James Shepherd has been chief engineer for the Mackle Construction Company since its organization and will add to his present activities the position of chief engineer with the new corporation.

## PRACTICAL SUGGESTIONS ON HOW TO BUILD AN HARMONIOUS HOME

By JOSEPH LARONGE, Cleveland,

There is no royal road to fortune. If you have made up your mind that you want a home of your own and you will stick to your resolution, you can get it and you will get it. Buy your lot—that is the first step. If you haven't all the money needed, buy it on terms. When the lot is paid for, you will be in a position to build your home.

Your choice of a lot should be influenced by the kind of home you are going to build on it. If you are going to build a bungalow, don't buy a lot situated between two big two-and-a-half story houses. If it's a duplex apartment you're building and it is to be built for investment, remember that it will cost as much to build on a cheap lot as on a better one, but the returns in rent will be considerably less. Let us illustrate this with figures. Suppose you purchase a lot costing \$1,000 and build a duplex apartment costing \$5,000. The total investment will be \$6,000. Your flats will rent for about \$25 apiece, or \$50 for both. Your neighbor buys a lot for \$2,000 in a better neighborhood and duplicates this house on it at the same cost, \$5,000. The total investment in the case is \$7,000, and these flats will probably bring \$40 to \$45 each, a total of \$80 to \$90 per month. Figure the difference for yourself on a percentage basis.

The price you pay for your lot should be in proportion to the cost of the house you intend building. For city or close-in property we would say that a good proportion for the value of the lot would be 25 per cent. of the value of the house to be built on it. But no matter what the kind, style or price of your home, the location should be desirable, for the benefit of yourself and your family while you reside in it, as well as the advantages it will give you in renting or selling, should such a move ever become desirable.

When you are ready to start to build your home, have your lot surveyed, so that you can be sure of your lines. You won't want to find at some future time that a portion of your house extended on some one else's property. Even if your lot is very large, you should have it surveyed so that you will know your boundary lines. Then, when you are ready to plant your hedge or build your fence, you can do so and know that you are right.

Do not permit yourself to be influenced by the homes of your friends or neighbors in the choice of your home. Let your own taste, judgment and

pocket-book be the deciding factors. One of the great American faults is this idea of outdoing one's neighbors. There is just as much happiness (oftentimes more) in a simple bungalow as in the costliest mansion. The children's ideals will not be harmed by simple surroundings. Don't try to build without a well-prepared set of plans and specifications. They will form the basis of your contract and will insure you getting what you bargained for. Whenever you see a poorly proportioned and badly arranged house you can rest assured that it was either built without a plan or built from plans drawn by a carpenter who knew nothing of architecture. A good set of plans will add very little to the cost of your home and will save you many times their cost, both in time and money. They will be an insurance policy that will protect you from mistakes.

Don't take chances on the construction. You want your home above everything else, to be substantially built. Your contractor may tell you that you can save money by using lighter material. Don't do it. There are ways to economize, but this is not an economy. Your specifications should provide material and proper methods for your protection and you should not be satisfied with a substitute.

An open fireplace is a valuable addition to the heating arrangement. It furnishes an excellent method of heating a room quickly, and is one of the best means of ventilation known. It will save starting a furnace in moderate weather, when only a bit of heat is needed to "take the chill off."

Sanitation should be the principal features to look for in the selection of your plumbing fixtures. Have your specification call for open plumbing. Do not build drawers, shelves or anything else under the sink. Put in an enameled sink; it will pay you to do so. A rubber mat placed on the drain-board will prevent dishes from breaking or chipping. The height at which the sink is placed should be regulated by the housewife who is to use it. A sink that is too high is awkward, and a sink that is too low causes a lot of unnecessary, back-breaking stooping. Nickered plumbing is no more expensive than plain brass and adds greatly to the neat appearance of a bathroom.

An economical way to wainscot a bathroom is to use a hard plaster, marking it off in blocks like tile, and then painting it with several coats of white enamel. A tile floor for the bathroom is not as

expensive as you might expect it to be. In a bathroom 6x8 it will cost about \$35.00. There are several good, sanitary floorings on the market used as a substitute for tile. They are cheaper. Linoleum, laid before the fixtures are put in, makes a satisfactory floor covering.

The selection of the colors for the painting of your home will be left to you. Light colors, being composed largely of white lead, will wear best. If white is used, either for body or trim, an ivory white or cream white will be found more attractive than the glaring calcimine white. Any of the well-known paint manufacturers will furnish you, upon request, with a booklet showing a number of attractive color combinations. Your contractor can have his painter stain samples of wood to get the color effect you desire for your interior wood finish, or, if you want the woodwork to match your furniture, he can stain it accordingly.

Don't "sub" the job yourself, and don't let it out by day-work. Lawyers have a saying that "The man who pleads his own case has a fool for a client." The contractor is a man who has learned his business just as the lawyer or doctor has his profession. You should no more undertake to build your own house than you would to argue a case involving several thousand dollars. "Each man to his trade" applies with as much force to the building of a home as to anything else. A contractor who is constantly engaged in building houses can save enough money in the purchase of material and the arrangement of his work to bring himself a fair profit, so that the owner is put to no more expense and is saved all the worry that goes with directing the details. Contractors as a class are just as good as men engaged in any other trade or profession. There are undoubtedly some black sheep among them, as there are quacks in the medical profession and pettifoggers in law. But we have found contractors, as a class, to be competent, fair-minded and honest, and so you will find them if you don't try to get "cheap men."

When the house is completed and you are in it, plant trees, shrubs, vines and flowers all over the place, in the rear yard as well as the front. Put your grounds in such shape that you will have something beautiful look at from every window. It will take time, but it is worth it. It will require thought, labor and patience, but it is worth that, too, for you and your family will spend much of your time there. The humblest cottage in such a setting is beautiful. The trees, the flowers and the garden are a part of the home.

BOTH PHONES

THIS Autocar of J. J. O'Brien & Sons took the place of three teams. Now three more Autocars have been added, representing just so much increased business brought within reach of one store. Over city and rural routes Autocars are adding daily to the profits of thousands of business houses such as J. J. O'Brien & Sons and the J. E. Linde Paper Co.

**Designed to carry  
the paying load  
at the lowest possible cost**

THE motor of the Autocar is placed under the seat to do away with excessive overhang—to distribute the load evenly over all four wheels.

This equalization of load diminishes wear and tear on tires and truck. It allows of lighter construction, so that less power is needed to move the weight of the truck and more is available to move the paying load.

And the shorter wheel-base thus achieved gives the Autocar its extraordinary ease of handling, even in narrow streets and cramped quarters, where motor truck operation would seem impossible.

The fact that half the Autocars sold are repeat orders from the 7000 Autocar users is convincing proof of Autocar performance.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

## Lumber and Service

"Job lots and bargains are all right when you are buying collars or shoestrings," said the Old Man to his junior partners, "but if we decide to build this year, I want to know beforehand who is going to furnish the lumber. If this new addition is to be finished by winter, we shall need something beside flooring and shingles—we have got to have SERVICE."

And so the Old Man insisted that all the lumber should come from Lloyd—for he had had experience; he had paid a high price for it.

Can you make use of his experience in your building plans, or do you feel that you must have some fresh experience of your own?

## As The Editor Sees It

THE relative merits of engineers and architects as planners is a subject which has recently caused much discussion due to the fact that many contractors as well as engineers have ventured to undertake this phase of construction work, and a few with no small degree of success. There are, however, certain qualities inherent in the architect, the result of definite training in this particular branch of construction, which render him best fitted to fulfill the demands of designing and planning.

In discussing this interesting question, the *Building Review*, New Orleans, voices the opinion that

"If there is one field in which the architect is supreme, and has no equal in anything that appertains to building construction, it is planning. Above all else the architect is the world's expert in the economical correlating of areas and the subtle co-ordination of the functions of a building, whether it be a home, office building, church, or the biggest warehouse or factory.

It is from this standpoint, therefore, that the architect very often views some great engineering project which embodies great buildings or floor areas as an architectural problem. If it is not strictly an architectural problem, no more then is it strictly an engineering one. The architect may be lost in the engineering research and problems involved would not dare attempt their solution, yet the engineer nevertheless dares to plan to do that for which by

schooling, training and mental bias he is incapable of, and that is to plan areas. Occasionally will be found an engineer who also is a planner, just as at times an architect will be found who in addition is gifted with the engineering sense.

The problems of planning are not problems of construction at all; but the architect soon learns to plan with a subconscious sense of correct construction. That is, his plans involve no constructional absurdities, and in any case construction is readily adapted to plan. But not so the engineer. He is an able constructor and methodizer. He has, in the best type, far vision and cool judgment. He claims to assume nothing! But he does assume one thing, and that is, that he knows how to plan! Engineering planning of buildings is deficient because the engineer thinks more of construction than he does of plan. His business (aside from research and creative engineering) is primarily one that has to do more with stresses and strains, thrust and counter-thrust, expansion and loads, than with economy or beauty in plan.

The engineer constructs and then plans to fit this construction. The architect plans first; and the result often is a distinct saving because plan ought always to precede construction. By this is meant planning in its best sense—the skeleton layout and the intensive planning to use every foot of space, adapting each area to its specific purpose; adjusting its size, its cost, its location, its light-

ing, its mechanical facilities to the specific function it is purposed to perform; giving no more or less than is necessary. Whereas the engineer plans with broad sweeps, like the artist working in charcoal, and his plans are very much like the artist's charcoal sketch—a mere blocking in, and then the building is built in this unstudied form. We speak of this as a general rule. There are exceptions. The great cotton warehouses and terminal, and the public grain elevator both in New Orleans and both engineering works, are among the most highly co-ordinated structures in that city. These buildings may be likened to well-designed machines, for they are that and nothing less—the ratio of areas to mechanical equipment, the relation of one area to another, all exhibit a correct balance that is architectural in its spirit.

These exceptions merely emphasize the rule, however; and on large projects, if engineers will but concede the special value of architects in the sphere of planning and form an association with competent men on large engineering projects of this kind, the final result will be a better piece of engineering. The old, mistaken idea that architects are good only to "make things look pretty" must be discarded. Above all else the modern architect is a planner and in this he can never be approached by men who are untrained in, and inexperienced in the problems and niceties that good planning involves.

We see here a better common ground

for engineer and architect to meet upon than any other, and from such an understanding of each other's value there can develop nothing but mutual good to each profession, the furtherance of engineering, and the employment by architects of their special ability upon works that at first glance seem foreign to architecture but which in the light here shown proves itself to be simply a proper extension of the architect's work and a legitimate use of the architect by the engineer; just as the architect calls in the engineer to solve his own—the architect's—structural and mechanical problems.

The engineer is indispensable to the architect as a specialist in a field which the architect sensibly realizes is not his own except indirectly, and no less is the architect indispensable to the engineer in a field that, likewise, the engineer should realize is not his own except indirectly—the field of planning.

\* \* \*

**A**T the recent annual convention of The American Institute of Architects, held at Nashville, Tenn., probably the most interesting feature was the Post-War Committee on Architectural Practice. This very live committee is asking for opinions and seeking advice for architects throughout the country, to insure success of its efforts, to solve the questions vital not only to architects but to the world at large. "The individual," says the committee, "must appraise the value of the service he renders to his fellows, primarily through the measure by which the results achieved in the practice of his vocation are effective. Thus, as architects, we must ask ourselves these questions. Are we in right relations:

- I. With those whom we would serve—the public?
- II. With those with whom we would co-operate in the production of a building; with the engineering professions, the crafts, the industries and the trades organizations?
- III. With those who render the same service—our fellow architects, the students of architecture, the architectural schools, and, as professional men, with all those who render professional service?

The experience of the war has bared the weaknesses of long established methods of performance until institutions of every kind, hitherto thought to be effective, have been found wanting. The conditions affecting the

building arts, at this time, therefore not only suggest but demand, that they be given the same searching analysis that is being given to every human activity, in order to bring it into right relationship with the new world in which we are to live.

In order that we may get the facts on which to base a forward-looking program for our vocation, we ask every architect to co-operate with all his heart and soul, in the work of this committee. An outline of topics suggested from many sources is set forth with the idea of determining a direction along which lines of discussion should proceed. The committee assumes no responsibility for their validity in thus setting them forth, but wishes only to offer them as guides to discussion and investigation. What it does ask at the outset are hearty co-operation, candor of expression, self effacement and the avoidance of personalities. No matter what wrongs we may believe ourselves to have suffered at the hands of others we are now to turn the searchlight on ourselves—are we right?

Architects are already aroused to the necessity of co-operating with the committee and at a recent meeting of the Southern California Chapter of the American Institute of Architects the business of the evening was a discussion of architectural practice as it is being considered by the post-war committee of the Institute. The architects of the East have been considerably exercised by the lack of recognition accorded architects and the American Institute by the Government in the Federal building program during the war and the Post-War Committee is working to determine the cause and to secure suggestions for its correction from the various chapters. Mr. Bert L. Fenner, Executive Secretary of the Institute, was recently in California, on a tour of the country, and asked that the Western chapters consider the problem thoroughly under two divisions: "What is the matter with architectural practice?" and "Do the canons of ethics of the Institution need revision to be of more assistance to the architects?" The members of the Southern California Chapter are firmly of the opinion that the only way architects can secure better recognition is by rendering greater service. The most successful architect will be the one who renders the most efficient service. It was suggested that the architects should exercise particular care to see that plans and specifications were complete in every detail and not liable to misinterpretation. Also that the architects should pay closer attention to their work after the contracts

are let and assume a greater responsibility in the superintendence of the work.

Surely no profession today offers greater opportunity for service to mankind that does that of architecture. In the reconstruction of the world the architect must and will assume the place of first importance.

\* \* \*

#### DAWN OF A NEW ERA IN INDUSTRIAL ARTS FIELD.

A new era is dawning in the industrial arts field; war brought the opportunity. The war forced us to choose between aping Europe again now that the job over there is finished, or standing upon our own ability in the broad field of high class industrial art production and furnishing Europe from here. The schools must get to work in this serious business. The general schools must make their work in drawing useful; the schools for manual craftsmen must be busier and harder at work than ever; the schools for teaching designers have the greatest task for they must assure for us fine design for production on a large scale. And for this great work, which must be gotten under way immediately, our present schools are hopelessly insufficient in number and individually inadequate to the task. We have not a half dozen; we need a hundred even now.

Where are the great men who can see America's opportunities? Where are the educators that can lead and mould public opinion? Where are the long-headed manufacturers who have failed to regard schools as an asset yet who cry for designers now that Europe has called them back to defend the schools that trained them? Are there no giants among us who will insure the future of America in this field by acting at once? Let us have schools of industrial art, always more schools, and give them to us now!

RICHARD F. BACH,

\* \* \*

As a branch of the Own Your Home activities the salvaging of old houses is deemed important not only in its bearing on civic conditions, but in its power to arouse interest in new enterprises. In every community are old houses that have been permitted to run down until they have become eyesores. The big idea of one Kansas town was to salvage these houses by forming a fund with which to buy properties long neglected by owners and then to remodel the houses, making them modern and attractive in every respect. When fully restored the houses will be sold, thus one family obtains a home of which the city is proud and the whole community benefits.

## AMMORTIZATION WILL HELP THE BUILDING SITUATION

The Question of Loans Settled—Money Can Now Be Had—Build Now!

BY S. W. STRAUSS.

At the present time one hears much complaint about the unwillingness of financial interests to lend money for building projects. Among the various reasons put forward to account for the dullness in the building industry, has been that many lending institutions are not willing to make loans on real estate security. However much of truth there may be in such statements, no question has been raised as to the soundness of the real estate situation. Quite a number of lending organizations have declined to look with favor on building projects because of unstabilized conditions and the fact that higher prices prevail than existed heretofore. While building costs are higher now than they were before the war, materials used in this industry are low compared with the prices of food, clothing and commodities in general and there is no doubt in the minds of most men conversant with the situation, that we rapidly are reaching stabilized conditions.

During the four years prior to 1918 the average increase of wages in the construction industry in forty-one leading cities in the United States was 27.5 per cent., while the increase in commodities during the same period was 94 per cent. In addition to these basic facts no more direct recommendation of a specific class of loans ever was given official utterance than a statement given out recently by the United States Department of Labor, when, after investigation of the American realty market, it said:

"Investment in building always has been considered the safest for the individual."

Notwithstanding these conditions, there has been complaint from those engaged in the building industry that they could not secure adequate funds for carrying out their plans. Many of the large lending institutions, such as the insurance companies, trust companies, and savings banks have not been in a position where they could be of help in financing construction work due largely to the methods employed by them in making loans. It is gratifying to note that a widespread movement in mortgage reform has been inaugurated, however, and the situation should rapidly improve as a result of these remedial changes.

It is one of the lessons that should have been learned many years ago, but

it required the present readjustment period, with its manifold complications, to bring to light the defects of the old system and reveal the needs of radical mortgage reforms.

The situation may be briefly explained as follows: A great amount of capital available for building operations in former years is now tied up in Liberty Bonds. The life insurance companies have been drawn on very heavily as a result of the influenza epidemic which has necessitated the payment of an abnormal number of policies. The principal cause of the present lack of available funds at the hands of these organizations, however, is that they have been making loans without any adequate provision for their gradual reduction or amortization. That is, instead of loans being reduced by certain fixed amounts each year, they have been carried along from year to year with little, if any, payments on the principle. It is estimated that there are approximately \$10,000,000,000 in realty loans carried by all lenders on mortgage securities whether private or institutional, of which \$6,000,000,000 are held by savings banks, trust companies and insurance companies. The larger portion of these \$10,000,000,000 of securities based upon real estate in American cities and towns, carry no provision for gradual reduction. If these loans in the aggregate or to a great extent had been made on amortized mortgage security, there would be a vast sum of money flowing into the lending institutions each month which could immediately be applied in financing new projects.

It is in the widespread adoption of the principles of amortization in realty loans that the present reform movement consist and it is because of this fact that one is justified in making this statement that the amount of money available hereafter for building projects will be continually more plentiful as a result.

In applying these principles it must be remembered that a loan can not be amortized unless the property itself produces sufficient income so that the debt or a large part of it must be paid out of the income from the property. This is the only fair and scientific arrangement. There is no reason why the income from buildings should be diverted to other purposes, thus depriv-

ing the building industry of its own natural fruits.

With the application of amortization, the income from building goes toward the erection of other structures, thus creating a natural growth and upbuilding; thrift with both borrower and lender is promoted and the entire industry is stabilized because of the fact that its development is based on scientific principles. The general adoption of amortization will hurt the speculator—"the mushroom" promoter—but all worthy and legitimate building operations will be benefited.

That it rapidly is becoming accepted as the ideal method of making loans was shown recently when a canvas revealed that all but 18 per cent. of the leading financial institutions of the country were in favor of the application of the principles of amortization to the loans made by them.

Through the device of bond issues secured by a first mortgage on real estate the situation can be still further benefited, because bonds of this kind divided into popular denominations will furnish a medium by which the general investing public can give that degree of financial support to the building industry which is now so badly needed. The public long has financed railroads, public utilities and industrial corporations, but the realty market has very largely depended for its financial support on the large lending corporations. Since the greater part of building requirements consist of large projects running, in many instances, into hundreds and thousands of dollars, it would not be possible for the public to give any great amount of help to such financial tasks unless the mortgages on these constructions are made in the form of bond issues divided so that the individual investor can participate in them.

Thus the mortgage reform movement now going on will mean a great stimulation to the building operations of this country, although the financing of a very great percentage of all building operations of the future must be made with bond issues in order that the public may give its support to them.

Experience is teaching the popular investor the safety and desirability of these securities. Our Liberty Loan issues and our general practices of wartime thrift have created a tremendous new investing power in this country. The building industries are entitled to a full share of the support of this element and such support will contribute to the upbuilding of our American cities, afford the best possible outlet for the savings of our people and go far toward the encouragement of thrift among our people. National Builder

# Advance Construction News

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

**Bank (add.)**, Front and Norris streets, Philadelphia. Architects, William Steele & Sons Co., Sixteenth and Arch streets, Philadelphia. Owners, Industrial Trust, Title & Savings Co., John G. Garruth, president, 1950 North Front street, Philadelphia. Marble, stone and brick. Plans in progress. Too early for details.

Architect taking bids due May 26th at noon. John

## Lumber and Service

In a building operation everything must be on the spot at the right time. The first thing you need is SERVICE. The finest flooring in the world is of no use if when the men come to lay it you find it is stuck in a freight jam at Norfolk, Virginia.

The right kind of service avoids freight jams. When Uncle Sam was building, he called on us to help keep his lumber cars moving. So we have had a post-graduate course.

Fifty years' experience is at your service when you build, if you see that the lumber comes from LLOYD.

## Proposals

### INVITATION FOR PROPOSALS

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 5, 1919. SEALED PROPOSALS will be opened in this office at 3 P. M., June 2, 1919, for the installation complete of a hoistway and electric dumb waiter in the United States Post Office and Court House at Pittsburgh, Pa., in accordance with the drawing and specification, copies of which may be had at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

# Permits for New Buildings

O is the abbreviation for owner. C is for contractor.

The illustration shows the installation of the famous "Star" Ventilator on the War Trade Board Building, Washington, D. C.

## "STAR" VENTILATOR (Patented)

The "Star" Ventilator was adopted by the U. S. Government as its War Standard for cantonments and other important buildings, on account of its **HIGH EFFICIENCY** and **SIMPLICITY**.

The Thousands of "Star" Ventilators in use on public buildings, schoolhouses, mills, warehouses, and similar structures throughout the country, proves their superiority over other types.

We also manufacture Evans "ALMETL" Fire Doors and Shutters, Metal Tiles and Shingles, approved by the U. S. Gov., and High Grade Roofing Tin.

## As The Editor Sees It

**T**HAT the high prices brought about by the war are here for a somewhat protracted stay, must at last be admitted by the most unwilling mind. Industry has been greatly retarded because of the reluctance of the public to accept conditions and make the best of them. Some very interesting views on this vital subject are given in the *American Contractor* by John J. Arnold, Vice-President First National Bank of Chicago.

"That the United States of America ranks as one of the leading creditor nations," says Mr. Arnold, "if not the leading creditor nation of the world, is admitted by economists the world over. This position was thrust upon us with a suddenness which is almost startling. We are now trying to find our equilibrium. In our confusion many have come to the conclusion that we at the same time have come into the position of the world's banker.

From this attitude I personally dissent. The fact of the matter is we have come into the place of a creditor nation through a process which, if not unnatural, nevertheless must be considered as abnormal.

The United States prior to the outbreak of the war was a debtor nation to the extent of approximately six billion dollars. The accumulation of this obligation, however, covered a long period and, in fact, had its beginning from the early days of our independence.

When a nation imports more merchan-

dise than it exports, the difference between the two must be settled for from time to time either by the shipment of gold and silver or the giving of a promise to pay at a future date. These obligations or promises were represented by a mortgage on our farms and real estate and stocks and bonds against our industries.

Because the process was a gradual one European financiers and bankers found it possible to develop an investment clientele, which with us in our present condition, is almost entirely lacking, and until such a market has been created we cannot consider ourselves as ranking as the world's banker.

The situation which confronts us is serious, and it may be necessary that our Government accept from the European governments further government bonds or promises to pay for the interest which will be due from year to year.

It is desirable from every viewpoint that government financing should be discontinued at the earliest possible moment. Private enterprise should be stimulated by private financing, which will most quickly bring about deflation.

The high cost of commodities and labor, of course, is partly due to the increased demand for raw materials and the curtailment of production for peace purposes.

The world today is glutted with government securities, which include both bonds and the medium of circulation

known as currency, and the sooner we begin the process of reducing both the sooner can we figure on a lower cost of living.

From the standpoint of the student of economics, it is absolutely futile for peace industry to wait longer for pre-war commodity prices, and everything should be done to encourage the resumption of peace business, which alone can accomplish what we all desire.

In other words, the production of new wealth is absolutely essential for the reduction of costs. The normal way to reduce the price of wheat is through the farms producing a large quantity. That is to say, we must place the emphasis upon a greater production rather than upon consumption of commodities while in the field of governmental securities the opposite is the end to be accomplished.

Bankers, quite naturally, are interested in the growth of their deposits, and so long as such growth represents actual deposits the condition is a healthy one. Deposits, however, which are created through the making of loans cannot be considered of this character.

If a customer borrows \$100,000 from his bank and the amount is immediately placed to his credit, both the loans and the deposits of the institution have been increased an equal amount, but such a transaction does not represent added strength to the institution and if carried to the extreme may even prove disastrous. This is merely an illustration of

**DRAWING  
MATERIALS**

**CHARLES H. ROBBINS, JR.**

**BLUE  
PRINTS**

what has taken place through the world in government financing.

The note of the borrower represents an obligation to make repayment at some future date against which he has been given a credit balance upon which to draw for present use. Such a transaction is perfectly legitimate, and when carried on within the limits of power to pay should not be considered dangerous. In the present world situation, however, government obligations or promises to pay have been created beyond the point of ability to reimburse within a stated period. Refunding, therefore, is but a natural consequence.

Aside from this, we must not forget the distinction between borrowing for constructive purposes and borrowing for purposes of destruction. When the customer of a bank borrows the \$100,000 he is doing so for the purpose of creating new assets, while most funds raised by government borrowing during the war have been expended for destructive purposes. In other words, the materials used for the carrying on of our war are largely of no real monetary value now.

The development of the natural resources of countries such as Russia, China, and the Americas, will make it possible for industrial countries, such as England, France and Germany to have a normal and healthy growth. Economy and savings will have to make proportionate contributions. This condition, however, is likely to follow as a natural result of taxation and the high cost of living.

These conditions forced upon the laboring classes or wage earners might, naturally, create a revulsion of feeling toward any one living in affluence and wealth or practicing extravagances. If, on the other hand, those who are the possessors of large private fortunes use the power which wealth has given them for the good of others this feeling naturally becomes modified. Under such circumstances riches do not necessarily become a curse. This applies to nations as well.

For America to serve as the world's leading creditor nation carries with it elements of great responsibility, as well as elements of great danger. The attitude of the outside world toward us is dependent largely upon how our power will be made use of.

The fundamental principle of democracy is to aid the other fellow, which will naturally react in benefits to the one who furnishes the aid. It should, therefore, be our aim to help rehabilitate the old world and put the devastated countries on their feet. It is estimated that the European nations will be called upon to pay us annually in-

terest amounting to approximately five hundred million dollars.

In my judgment, the United States could well afford to say to the European powers that this amount should be paid into a fund in Europe which we would expend for the rehabilitation of the devastated sections of the continent. This would mean that for the period of time required for the rebuilding of Europe we would be loaning our funds without interest.

I think it is generally admitted that the greatest investment which we as a country have ever made was when we remitted to China the amount of the Boxer indemnity. This has brought about an understanding between China and America and a relation of friendship which could not have been accomplished in so short a time in any other way.

A contribution such as I am suggesting would forever eliminate the charge of "dollar diplomacy" in our international life, but even aside from the harvest which we would be likely to reap in the spirit of friendship which would thus be created, I am confident that in the long run it would prove profitable even in dollars and cents.

\* \* \*

THE arguments set forth by Mr. Arnold apply very specially to the construction industries. No industry has been more curtailed by the war than that of building; and, as has been repeatedly demonstrated, curtailment of building at one period in the growth of a nation necessitates a great speeding up at some future time to overcome the deficiency of dwellings, factories, etc. High prices now prevailing in real estate are a direct result of this existing deficiency in homes.

Mr. Arnold points out the difference between expenditure for destructive and constructive purposes. Just as war is the foremost example of expenditure for destructive purposes, so agriculture and building stand first in the field as examples of constructive industry.

"Any practical builder," says Allen E. Beals in the *National Builder*, "should be an optimist today!

His profession has risen in importance. It has become a concern of the Government, and competes with agriculture as a necessity of life.

National authority is perplexed to find 600,000 homes this year, on a conservative estimate, for America's inhabitants.

Up to November 11, 1918, just five months ago, construction was almost completely barred. Only \$300,000,000 worth of building was allowed to proceed, outside of that required for war purposes. This \$300,000,000 worth of building for the entire country in eleven

months is equal to the construction work in a single large city for one year in normal times.

Since then up to April 1, construction has gone ahead, with projects amounting to \$250,000,000, indicating a total of \$600,000,000 worth of building work—supposing no further monthly gains are made.

But gains must be made for there is urgent need for three times that annual expenditure.

Pessimism must be banished by the builder himself. He must realize that the entire country is rising to meet the need for building—rising in even mightier power than it rose to meet the power of the Hun.

We are the richest people in the world today. We have to readjust things a little, and we are readjusting them rapidly. Prices and credit—money—have kept us thinking at cross purposes.

The trouble now is that instead of the fear that prices will go down in a few years and not leave the value in a building equal to that which was put into it, that prices will go up before projects can be started.

This sharp turn in the mental attitude of prospective builders has been met by the voluntary guarantee of manufacturers and material men that prices will not be advanced for a year.

The long-awaited for stabilization is here!

The builder's customer must be shown. He needs to learn from you the national demand that keeps the cost up where it is. He sees your estimate and then decides to wait. For what? Does he imagine that by waiting he will gain? If so he is unprofitably advised, unless he is prepared to wait for at least five years. He needs to know that immigration will be stopped, and that the labor that is leaving the country will keep costs up even more than the war itself.

But the big view—the one in which the Government is most concerned—is that which is presented by industry. A myriad mills are closed, and each day their doors and gates are locked labor has to be distributed elsewhere. This distribution is invariably toward the great cities. The greatest menace to building is in this condition; not from political sources, but from the increasing cost to the mill men to produce that which builders use in assembling structures. The exodus from mill centers puts a premium on the services of the men who stay and thus the figures of manufacturing costs show that the reduction in prices hoped for by the builder's customer cannot be realized for a long, long time—when everything else has come down also.

Opportunity is here! The builder need

not hesitate. National statistics prove that building is unleashed and is gaining headway for one of the most prosperous eras America has ever known.

It is up to the builder to take hold of the opportunity. To know it and—to realize it—and then go out and show his customer where he can turn his money faster in construction than by holding it in futile hopes of lower cost.

Prices have now been stabilized at rock-bottom figures."

\* \* \*

#### ARCHITECTURAL ETHICS.

The following code of ethics was adopted recently by the Federal Council of the Australian Institute of Architects, and is now being considered by the various State Institutes:

Clause 1. No member shall enter into partnership, in any form or degree, with any builder or contractor.

Clause 2. A member having any ownership or beneficiary interest in any building material, device, or invention proposed to be used on work for which he is architect, shall inform his employer of the fact of such ownership.

Clause 3. No member shall be a party to a building contract except as "architect" or "proprietor."

Clause 4. No member should guarantee an estimate or contract by personal bond.

Clause 5. It is unprofessional to advertise other than when changing address, and then for not more than six insertions, in any particular paper, giving name, address, profession, office hours, and special branch of practice desired.

The Institute does not object to members exhibiting the name and address of architect on a building in course of erection, providing that space occupied by name and address does not exceed five feet super.

Clause 6. It is unprofessional to solicit work or attempt to supplant an architect, after definite steps have been taken towards his employment.

Clause 7. It is unprofessional for a member to criticise in the public prints the professional conduct or work of another member, except over his own name, or under the authority of a professional journal.

Clause 8. It is unprofessional to furnish designs in competition for private or public work, unless for proper compensation, or to take part in any competition as to which the Council have declared by resolution that members shall not take part, because the conditions are not in accordance with the published "Suggestions for the conduct of Architectural Competitions," prepared by the Federal Council of the Australian Institute of Architects."

Clause 9. No member should submit drawings, except as an original contribution any duly instituted competition, or attempt to secure work for which such a competition remains undecided.

Clause 10. The scale of professional charges prepared by the Federal Council of the Australian Institutes of Architects, and adopted by the Institutes, represents minimum rates for competent service.

Clause 11. No member shall compete in amount of commission or offer to work for less than the scale of charges provided in Clause 10.

Clause 12. It is unprofessional to practice with an architect who has been expelled from, or who is not a member of a recognized Institute of Architects.

Clause 13. Members are not permitted to accept any trade or other discounts or give or accept any illicit or surreptitious commissions or emoluments in connection with any works the execution of which they may be engaged to superintend, or on which they may be employed in any capacity.

Clause 14. A member should so conduct his practice as to forward the cause of professional education and render all possible help to juniors, draughtsmen, and students.

—*The Architect and Engineer.*

\* \* \*

An experiment made by an Ohio city proves what an effect a model house may have on a local "Own-Your-Own-Home" campaign. The real estate board of the city selected a most attractive plan. This was quite out of the ordinary, in colonial style, the entrance being at the side through a portico, while the wide porch extended across one end, the outside chimney going up through it and affording an opportunity for an outside as well as an inside fireplace.

Most of the contractors and material men worked at cost. A number of builders and merchants made substantial donations. When the house was finished \$400 was spent in advertising, and one afternoon 5,000 persons went through the house, while as many more stopped to admire it from the outside. It was sold at a reasonable price, but at a profit, and, as a result of the demonstration in home building, many persons were interested to the point of taking steps to own their own homes.

This model house idea is suggested as a first-rate method of centering interest in a local campaign, for it affords a means of showing exactly what construction at present-day prices of material and labor, costs in a special place, and the house, inevitably much advertised, is readily sold.

—Ex.

#### PERSONAL NOTES

W. P. Cameron, for five years New Jersey sales agent for the Belmont Iron Works, and subsequently purchasing assistant for hull steel for the Emergency Fleet at Washington, upon discharge from the United States Navy, has opened offices in the Witherspoon Building, Philadelphia. Mr. Cameron is president of the W. P. Cameron Engineering Co., contractors and engineers for structural steel bridges and buildings, ornamental iron and steel of all descriptions.

Contractors should be prepared hereafter to offer bids on hangars, just as they would on ordinary garages. Some weeks ago ground was broken at the Ashburn Flying Field in Chicago for the hangars to serve as a receiving station for the Chicago-New York aerial mail, and to house the airplanes to be used in the service. With the return of the aerial forces from Europe the airplane will come into greatly increased use in both public and private service.

—Ex.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

#### Proposals

##### INVITATION FOR PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 21, 1919.—Sealed proposals will be opened in this office at 3 P. M. June 18, 1919, for furnishing and delivering at the site the materials required for the construction of the United States Post Office building at Clinton S. C., including materials for concrete, reinforced concrete, stone, granite, brick, structural terra cotta, structural steel, miscellaneous iron and steel work, composition roofing, slate roofing, sheet metal work, skylights, plastering, interior marble, sanitary slate, lumber, millwork, painting, glazing, hardware, plumbing, heating, electric work, etc. Bills of quantities and specifications may be obtained from the custodian of the site at Clinton, S. C., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 21, 1919.—Sealed proposals will be opened in this office at 3 P. M. June 18, 1919, for furnishing the labor required in the construction complete, with materials that will be furnished by the Government, of the United States Post Office Building at Clinton, S. C. Drawings and specifications may be obtained from the custodian of the site at Clinton, S. C., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

**Lumber and Service**

"Job lots and bargains are all right when you are buying collars or shoestrings," said the Old Man to his junior partners, "but if we decide to build this year, I want to know beforehand who is going to furnish the lumber. If this new addition is to be finished by winter, we shall need something beside flooring and shingles—we have got to have SERVICE."

And so the Old Man insisted that all the lumber should come from Lloyd—for he had had experience; he had paid a high price for it.

Can you make use of his experience in your building plans, or do you feel that you must have some fresh experience of your own?

**WILLIAM M. LLOYD COMPANY**

Established 1868

29th and Ridge Avenue

PHILADELPHIA

Daniel E. Hogan, 6043 Columbia avenue. Brick, 2 stories, 16x47 feet, 12x12 feet, slag roof, hot water heating, hardwood floors, tile work. Owner will build.

The illustration shows the installation of the famous "Star" Ventilator on the War Trade Board Building, Washington, D. C.

## "STAR" VENTILATOR (Patented)

The "Star" Ventilator was adopted by the U. S. Government as its War Standard for cantonments and other important buildings, on account of its **HIGH EFFICIENCY** and **SIMPLICITY**.

The Thousands of "Star" Ventilators in use on public buildings, schoolhouses, mills, warehouses, and similar structures throughout the country, proves their superiority over other types.

We also manufacture Evans "ALMETL" Fire Doors and Shutters, Metal Tiles and Shingles, approved by the U. S. Gov., and High Grade Roofing Tin.

### An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

### ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

## As The Editor Sees It

NOTHING could produce more unbounded joy today than the longed for drop in building prices. The existing shortage of houses and apartments in the country must be overcome, yet there is still a reluctance on the part of many prospective builders to go ahead with their work, in view of the vain hope for lower prices. This reluctance to build and the holding up of these very necessary projects are among the causes of the high prices prevailing today.

Cutting down production, producing less food, less clothing, less fuel, less construction material, never has and never will reduce prices. Increase production is the answer to the question of how we can reduce living costs.

We must have production if we are to have lower living costs. In modern industry production is stimulated by construction. Construction is a basic industry. If you build a home you make business for more than a hundred correlated and contributing industries. Each building erected sends its wave of demand through the industrial organization, from the ditch diggers to the bank presidents and back, and, by way of pay envelopes, to the ditch digger again.

An immediate resumption of construction activities will do more than any one thing to stimulate general business and accelerate the transition of industry from war demobilization to the peace normal.

Construction stimulates production—it creates the demand—and production

must increase until it reaches the volume production necessary to decrease unit costs before prices are lower.

A universal construction program means more to the United States right now than at any time in its history. It means individual efficiency of labor; it means increased production in all correlated industries; it means increased material demands until production reaches the quantity production level necessary for reducing unit costs; eventually it means lower prices.

Construction material prices will not be lower until production is increased; costs will not go down until quantity production permits us to avail ourselves of the economy of the maximum efficiency of labor and machinery.

To increase labor efficiency; to increase production; to lower construction material prices—build now.

\* \* \*

IN last week's issue of the "Guide" we discussed the relative merits of architects and engineers as planners. We are of the opinion that the field of architecture is distinct and separate from that of engineering, but both are necessary for the success of construction. Nevertheless there is still much rivalry between the professions, and a continual overstepping of the bounds which separate them. There should, we believe, be harmony and unity.

According to Mr. George Hancock in his presidential address before the North Dakota Architects' Association, en-

gineers, by their energy and success in gaining the public ear, are fast driving the modest, timid architects out of business. To offset this tendency, he continued, we notice that many architects, in order to keep up with the procession, have added the title of engineer to that of architect for the purpose of impressing the public with their superior qualifications over and above that of the properly trained architects who make no claim to other professions. Architecture and engineering are two separate and distinct professions, and it is given to but few men to master the intricate details of both, so that in most cases the assumption of the dual title is used for the sole purpose of gaining advantage over those who do not have the temerity to adopt such with little or no preparation.

The Massachusetts Institute of Technology makes the distinction between architecture and engineering and has separate courses for the training of students in each, as either is all that the average intellect can properly master with credit to himself. So that the mere adoption of a title without the necessary training to properly sustain it should at least be discouraged by all self-respecting architects.

Some professions, such as the law, are held in less esteem than that of architecture, and if we would increase respect for our profession we must command it through our work and that will bring us the public recognition we so urgently need.

It is useless for us to look to the law courts for protection, as the lawyer is the only winner where such efforts are made, but as a reason for hope in the improvement of our chosen calling, we have only to look at the host of poorly paid teachers and clergy to learn that our lot is no harder than theirs, in the matter of lack of appreciation of the service they render to the public. It is well to think of others when disposed to complain of our lot.

If we could succeed better than they we must do better and nobler work, with our minds set more on achievement than on temporary financial success. It is futile to complain that this is a commercial age, with but little public appreciation of art; such whining does no good and only indicates weakness. There is just as much artistic taste and feeling in the world today as in the days of Titian and Michael Angelo, and it is for us to satisfy this artistic taste and feeling if we would succeed in gaining for our profession the respect and recognition to which we believe the nobility of architecture is entitled.

During the past ten centuries architecture has come through many changes and developments. The eighth and ninth centuries gave us the unique creations of the Saxons; the tenth and eleventh centuries the solid, honest Norman work that has so well stood the test of time, as evidenced at Winchester and Durham.

The twelfth and thirteenth centuries gave us the pure and graceful early French and English Gothic that so clearly expresses the aspirations of the people of those nations in the magnificent creations of Rheims and Amiens, Salisbury and Westminster, the like of which has never been seen before or since that age. The fourteenth and fifteenth centuries gave us the geometrical and perpendicular styles, often referred to as the climax and full development of gothic architecture in Europe.

Such art and architecture as the people of those times produced should serve as a stimulant to greater efforts of the younger architects of our time. They had no examples to guide them and their work was the result of creative and imaginative concentration and skilful independent effort.

Shall we, then, with all these beautiful examples before us and the numerous examples of the Renaissance of the sixteenth century, and the more recent productions of Jones and Wren and the revival of the Romanesque by Richardson and Hunt in this country, fail for the lack of making an effort to merit the recognition we so earnestly crave? No, we must attempt much even if we accomplish little, but as effort is the parent of results, we can expect no recognition

by the public unless we command its attention.

By education and experience the architect of today should be better qualified to handle successfully building operations of all kinds than men not having such qualifications, but the public cannot appreciate this for the reason that the architects have not done their part in the instruction of the public to the point of appreciation of their service to their clients and to the public in general.

Undue modesty on the part of the trained architect is doubtless the cause of this shyness and should be overcome by a much-needed change in the method of bringing the client and architect together, on a better and fuller understanding of their relationship to each other, and to protect the public from the trickery of the faker and charlatan who is ever ready to pluck the fruits of honest effort along all professional lines. The men who have fitted themselves by great expenditure of money and time to serve the public in an honest and skilful manner must have some protection as against quacks who have no training in architecture and who do their work by proxy and only see the commission or money side of the profession.

The licensing of all architects is a reasonable solution of the problem.

\* \* \*

#### THE QUANTITY BUREAU IN AMERICA

All builders have probably heard of the quantity survey system of taking off quantities from plans. Most of you approve of it in so far as the theory of the system goes, but its actual application in America has received but scant publicity and you are somewhat in doubt as to its practical value in your work. You are not sure that such a scheme is possible in this country nor that it is adaptable to our methods.

You may not know that there are now several professional Quantity Surveyors in independent practice in this country and that there are a score or more of quantity survey bureaus maintained by as many different associations connected with the building trades.

A brief description of the quantity survey system as practiced abroad will refresh your memory and prepare you for the description of the adapted methods now used in America. The system probably originated in England and it has spread from there to Scotland, Ireland, Australia, France, Germany, and South Africa, and within the past ten years to America.

Wherever the system has gained a foothold it has crowded out the old haphazard methods of "guesstimating." In England the Quantity Surveyor is a professional man who devotes his entire time

to the practice of his profession. He is a highly trained expert who takes off the quantities from the plans. He lists every single solitary item that goes into the work; he goes through a plan with a fine toothed comb and nothing escapes him. He can't afford to *guess*, he must *know*! His professional standing depends on the reliability of his lists of materials. This makes him careful and exacting and if the specifications are vague or if the plans are not definite he immediately calls on the designer for a clear explanation. Thus the doubtful points are taken care of before the work is begun and while the designer remembers just what he intended to do. The long list of "extras" is reduced to an almost negligible quantity and the many disputes growing out of them are avoided.

In general, the professional Quantity Surveyor in this country follows out the methods used abroad. That is, he is a professional man just as the architect or builder is. The extension of this new profession to builders in general is highly problematical and it is doubtful if its services will ever be available outside of the larger cities. On the other hand, the success of quantity survey bureaus as established by builders' organizations is practically assured, even in small communities.

In establishing such a bureau the first thing to be done is to get together. This means that an association must be formed. This organization must be a permanent one, and a live one. Regular meetings should be held and the meetings should be devoted to discussions of the problems in hand. We have lately found that competition doesn't mean that we are to stand alone and make all of our moves in secret. We have found that we are the gainers by associating with men who are attempting to solve the same problems that we are working on. This sort of an association isn't a far-fetched dream, it is a present reality that has been proven wholly practicable. In those that are operating today you will find members who are the liveliest of competitors actually working together to solve some particularly difficult problem.

From the very first it must be understood that in forming a quantity survey bureau, every member must do all in his power to make it efficient. Each individual must lay bare his so-called "trade-secrets." He must give the bureau every advantage to assure its success.

It is often difficult to persuade a man who has built up what he considers to be an efficient method of estimating, that he will derive any benefit from allowing his competitors to use his knowledge of taking off quantities. He argues that it is this very thing that makes him suc-

cessful and that if he puts them next to his methods he will lose his advantage. This argument is not only selfish and narrow, but it is shallow. We all know that most of the failures among builders are due to faulty methods of estimating. A man may be honest and a creckerjack when it comes to handling the work in the field, but he is weak on taking off quantities from the plans. He "guesstimates" on a job; often lands it for that reason; and sooner or later goes broke. In the meanwhile, the man who has the efficient method of estimating, but didn't get the work because his competitor guessed wrong has plenty of time to sit around and figure out how much it cost him to bid on that job.

If each of these men had based his bid on the same lists of materials, there would have been fairer competition, based on true values and neither would have suffered any great loss. Another thing, the man who prides himself on his superior knowledge of estimating may be fooling himself. It is rather easy for some people to consider that they have a monopoly on all of the trade secrets and that nobody can tell them anything. These persons often find that the very secrets that they guard so carefully are "old stuff" to their competitors and have long been discarded for more accurate methods. It is pretty hard to find anyone who can't tell us something new these days.

Another objection that has been raised is that it gives outsiders a chance to come in and bid on work that rightfully belongs to another community and lays all of the figures open to the inspection of outsiders and places them on an equal footing that is unfair to the local builders who have built up the system.

By the very nature of things this is no more true of the new system than of the old one. The only thing that there is of common access is the bill of material. The cost of the material and the labor of placing it is still on a competitive basis. The outsider will have no more knowledge of your methods of arriving at costs than your associates in the bureau. But to remove this bone of contention, there is no reason why a non-member should be given the lists of quantities. Let the outsiders "guesstimate" in the usual manner. But, be careful, he may "guesstimate" too low and land the job because he failed to include everything. This is a ticklish point that should be carefully considered.

As a practical working example of how these bureaus are conducted two of those now successfully operating in Milwaukee, Wis., will be discussed. One is the Millwork Bureau, the other is the Concrete Builders' Bureau. Each has

been operating for more than six years and is thoroughly established. The success of these bureaus is entirely due to the co-operation of the members. They are more enthusiastic today than when they were established. This is shown by the attendance at their weekly dinners which averages 85% of the total membership. At these dinners every man strives to outdo his neighbor in doing his bit toward helping the other fellow. Criticism is strictly taboo unless a remedy for the evil accompanies it.

The actual operation of these bureaus is comparatively simple; the plans are delivered to the bureau and turned over to an expert estimator. This estimator has nothing to think about except his bill of materials; all of his time is given to estimating. He lists the quantities and checks and rechecks his estimates until he is sure that they are correct. Uniform lists of the materials are then prepared and given to the bidders. Only those bidders who present written orders from the owner or architect are entitled to receive the lists. No member of the association is allowed in the estimator room at any time. This rule is to prevent members from knowing just what jobs are being estimated. In the Concrete Builders' Bureau the cost of estimating is based on the percentage of cost of the material: 1% on jobs running below \$50,000.00 and 1/2 of 1% on those above \$50,000.00; this fee being paid by the successful bidder and any surplus remaining at the end of the year is returned to the members.

In the Millwork Bureau the cost of maintaining the bureau is charged to the members at the end of a certain period of time and the amount each member pays is based on the amount of work that he does during that period. The two methods amount to practically the same thing. The members pay for what they get and no more.

A summary of the advantages of the quantity survey system includes these points:

1. The cost of estimating is reduced by doing away with a duplication of work.
2. The man who gets the job pays for the estimate. The unsuccessful bidders are put to only a fraction of the expense that now prevails.
3. The bidding is on a true competitive basis and the gambling feature is almost eliminated.
4. The estimates are far more reliable, as much more time and study can be given to them.
5. The plans and specifications are rendered more exact as the designer is called on for explanations of any doubtful points before the contract is let.
6. The lists may be used in accurately

determining the amounts of payments due on certificates and in adjusting the prices for added or omitted work.

7. Builders have more time to spend on work instead of being in the office figuring jobs.

8. The "skinner" is forced to bid on exactly the same terms as his honest brothers.

—NATIONAL BUILDER.

\* \* \*

## "LEAGUE OF NATIONS" IN BUILDING TRADES TO HANDLE ALL DISPUTES.

By EDWARD A. ROBERTS,

*Secretary Cleveland Builders' Exchange.*

Following closely the proposal for a league of nations is an alliance now being formed to abolish the evils of jurisdictional disputes on buildings. The differences between the trades have been a frequent and persistent cause of strikes. If the peace plan carries, a blessing will have been bestowed upon all elements of the building industry.

According to statistics compiled at Washington this industry is second only to agriculture in national importance. This fact emphasizes the benefits to be derived from any movement which reduces to a minimum the obstacles in the way of its steady progress. The additional fact that all branches are back of this new undertaking and that the general plan has already been adopted by representatives duly qualified to act, promises well for its ultimate realization.

Preliminary steps were taken at a recent conference held in Cleveland following which an outline of the scheme was printed and is now being considered by national organizations enrolled in the movement, including the American Institute of Architects, the National Association of Builders' Exchanges, the Associated General Contractors of America, the building trades section of the American Federation of Labor and the United States Department of Labor. All of these organizations are enthusiastic in support of the plan. \* \* \*

The far-reaching effect of the move can be understood only when present conditions are studied. Scarcely can a building of any kind be erected without interruption and interference, sometimes very costly as to what trade shall perform certain features of the work. These points of difference have arisen from the gradual development of specialized trades and contending claims for work among these trades.

The introduction of new devices and appliances has added complexities to the situation. In some instances certain work is claimed by three or four classes of workmen. While the contractor or owner is willing to go along with any

# Barrett Specification Roofs

Barrett Specification Roof on Plant No. 3 of The Studebaker Corporation, at Detroit, Mich. Roofers: The Howie Company, Detroit, Mich.

Photo at left: Barrett Specification 20-Year Roof on Acid Plant of Swift & Company, Harvey, La. Roofer: Kracke & Flanders Company, New Orleans, La. General Contractors: Huggar Bros., Montgomery, Ala.

This is the Bond that guarantees your roof for 20 years

## Cover Your Investment with a 20-Year Guaranty Bond—

Every one knows that a structure of brick and steel and concrete will endure for a generation and more.

But how about the roof that covers the structure?

Frequently that is not only an unknown quantity but a *liability* rather than an *asset*.

It is a short-sighted and costly policy to put a *poor* roof on a *good* building

As one of the oldest and largest manufacturers of materials used in constructing roofs, we have done our part to make *all* roofs *good* roofs.

Years ago, for that reason, we induced the leading architects and engineers to unite in the adoption of The Barrett Specification as a satisfactory *standard specification*.

Now we go a step further by sending our Inspectors to check up on the construction, and if they find that The Barrett Specification has been properly complied with, we will, without charge, issue a 20-Year Guaranty Bond *exempting the owner from all further expense for repairs or up-keep on that roof for twenty years*.

This service may be had on all roofs of fifty squares or larger in all towns of 25,000 population or more and in smaller places *where our Inspection Service is available*.

Our guaranty is a real Surety Bond issued by the U. S. Fidelity & Guaranty Company of Baltimore, one of the largest Surety Companies in America. Our only requirement is that the roofing contractor shall be approved by us, and that the Barrett Specification dated May 1, 1916, shall be strictly followed.

Thus, in spite of the fact that we do not build roofs ourselves, we are put in a position where we can guarantee the delivery of the long years of service which these roofs are capable of giving.

*A copy of The Barrett 20-Year Specification with roofing diagrams, sent free on request.*

The "Builders' Guide" is in its thirty-third year of continuous publication.

## Lumber and Service

In a building operation everything must be on the spot at the right time. The first thing you need is SERVICE. The finest flooring in the world is of no use if when the men come to lay it you find it is stuck in a freight jam at Norfolk, Virginia.

The right kind of service avoids freight jams. When Uncle Sam was building, he called on us to help keep his lumber cars moving. So we have had a post-graduate course.

Fifty years' experience is at your service when you build, if you see that the lumber comes from LLOYD.

Factory, 347 North Fourth street, \$565. Alfred E. Garrett (O), on premises. Hatchway enclosure. Frank Reeder & Sons (C), on premises.

Garage, 1509 Germantown avenue, \$2,500. Henry Katz (O and C), 1535 Germantown avenue. Fire repairs.

Sunday School, 8814 Germantown avenue, \$1,500. Chestnut Hill Methodist Episcopal Church (O), on premises. Brick, 1 story, 6x20 feet. George S. Roth & Sons (C), 2306 Gravers lane.

(Continued from Page 321.)

of the trades, he is forced to await the outcome of a troublesome process until the point at issue is determined. In many cases buildings nearly ready for occupancy have been held up for months because of some trivial dispute of the character.

Some of the squabbles of most frequent occurrence arise over whether the carpenter or sheet metal worker shall install certain kinds of trim; whether the electrician or elevator constructor shall install certain elevator work; or whether the plumber, steamfitter or some other worker shall put in work claimed by all of them. Recently a dispute between the slate roofers and carpenters as to which trade should place asphalt shingles has caused some delay and trouble on various jobs in Cleveland and other cities.

At each session of the building trades department of the American Federation of Labor for years, claims similar to the above have been fought out, consuming a great deal of time and causing considerable bitterness. Even after decisions have been rendered great difficulty has been found in enforcing them. On this account an interim meeting of representatives of all trades, was held a few years ago and counsel was taken as to how to accomplish the desired results. Authority was given the president of the department to take steps to remedy the difficulty. Only a small measure of success resulted. So it has come about that the international leaders of the workmen are themselves the most enthusiastic promoters of the present alliance. They declare that the feature of the plan for the league of nations gives them the idea upon which they are working. It is confidently stated that if all of the elements now combine in the creation of the plan and work for its enforcement, there can be no question as to its successful operation.

In cases where organizations of workmen express dissatisfaction with the rulings and decisions and undertake to ignore them the entire power of the league will be brought to bear upon such recalcitrant and such organization will find it exceedingly difficult to go along under such a handicap.

The prelude to the plan as outlined in the printed circular sent to all interested bodies contains the following significant sentences:

"The close of the world war opens a new era of world democracy. A league of nations has been created to bring about unity of action that will protect the weak against aggression by the strong and in-

troduce conciliation and arbitration as a means of settlement of differences between nations instead of by war. We should have a league of all interests in the building trades to cement us into one solid body for conciliation, arbitration, awards and findings to settle disputes as to jurisdiction over work in the building trades claimed by more than one trade. May we not substitute peaceful methods in place of warlike ones?"

Briefly explained, the plan provides for the creation of a board "to investigate and pass upon jurisdictional disputes and render awards thereon as they arise or threaten between building trade unions." The board shall be known as the National Board of Jurisdictional Awards of the Building Industry, and shall consist of eight members and eight alternates, four to be selected by the Building Trades Department of the American Federation of Labor, and one each by the American Institute of Architects, the American Society of Engineers, the Associated General Contractors of America, and National Association of Builders' Exchanges.

The duties of this board shall be to determine by which trade any work in contention shall be performed and make an award in conformity with the facts submitted. These decisions shall be applicable throughout the United States and must be observed by all parties at interest. In cases of a tie vote by the board, an umpire may be agreed upon whose findings shall be final. This umpire shall be chosen by the board itself, but if unable to agree the Secretary of the U. S. Department of Labor shall be asked to name the umpire.

A feature of the plan worthy of special note that the employers are permitted in cases of disputes to proceed with such workmen as in their judgment they may see fit to employ pending a decision by the board. This makes the jurisdictional strike and resultant sympathetic strikes impossible. In the latter connection a section of the plan reads: "A law of the Building Trades Department of the A. F. of L. forbidding sympathetic strikes in cases of jurisdictional disputes shall be strictly enforced."

It is provided that the decisions of the Board of Awards shall be recognized by architects and engineers in writing specifications and by associations of employers in forming agreements with individual trades. Other features of similar character are incorporated for the purpose of making the proposed regulations binding and effective. The plan has the support of Cleveland builders.—*"American Property Owner."*

This is one of the famous  
**RICHARDSON Products**

Public Showroom:  
1332 Arch St., Philadelphia

The illustration shows the installation of the famous "Star" Ventilator on the War Trade Board Building, Washington, D. C.

## "STAR" VENTILATOR (Patented)

The "Star" Ventilator was adopted by the U. S. Government as its War Standard for cantonments and other important buildings, on account of its **HIGH EFFICIENCY** and **SIMPLICITY**.

The Thousands of "Star" Ventilators in use on public buildings, schoolhouses, mills, warehouses, and similar structures throughout the country, proves their superiority over other types.

We also manufacture Evans "ALMETL" Fire Doors and Shutters, Metal Tiles and Shingles, approved by the U. S. Gov., and High Grade Roofing Tin.

## As The Editor Sees It

THE movement for better housing conditions for workmen received a powerful impetus during the war, due to the necessity of attracting workmen to the sites of war industries. The call for decent living quarters and surroundings, which had gone unheeded for years, except in a few isolated cases, suddenly became a most vital factor in the winning of the war, and therefore had to be answered.

The lessons learned in this emergency are not to end, however, with the cessation of hostilities, but are to prove a benefit to the workingmen of future generations, and, through increased efficiency of labor, to the industries of peace.

"The demobilization of armies," says the *Manufacturers' News*, "the readjustment of industrial conditions, the first steps in the return to normal life after the demoralization of war," are today the most vital matters affecting the economic life of the nations of the world. No country can, or will, return to conditions existing at the beginning of the war. Among the many changes brought about by the years of struggle is the very important change in the matter of industrial housing.

In considering their reconstruction activities, both England and France have given careful thought to the question of housing of workers, and these countries, profiting by their war experience, have made very definite plans regarding the re-establishment of permanent homes for

labor turning from war-time to peace-time industries.

In the United States, the U. S. Housing Corporation, a subdivision of the Department of Labor, has met the war emergency and has kept labor on the job by its promptness and efficiency and the businesslike methods of its administration. The after-the-war function of this organization now becomes to put at the disposal of the individual all of the information it has collected during the war emergency and to see that the individual family gets the benefit of its vast experience. Future plans of the government in this regard contemplate the disposal of the homes which have been constructed upon terms which will make it possible for the thrifty workman to become a home owner with the minimum hardship. In many industrial centers the government has already constructed homes for workers, but in order that those who do not live in the vicinity of these completed homes may also receive the benefit of its experience, the U. S. Housing Corporation has arranged to furnish its plans to those who may desire to construct similar homes.

Unquestionably the Congress of the United States, which provided for the U. S. Housing Corporation as a war emergency, will continue this highly important government undertaking in some manner which will permit the American workingman to benefit as an individual from the experience of the government.

When the United States accepted the

challenge to fight for its existence, it became necessary, in order to carry out its war program, to provide for the fast increasing numbers of industrial workers in certain localities where war contracts had been placed and thereby insure their remaining at their tasks. It was found that in many of these industrial centers the congested living conditions made it impossible for war industries to secure and hold the labor necessary for their operation; that, chiefly as a result of inadequate housing conditions, the labor turnover often ranged from 200 to 300 per cent. a year, with the attendant financial loss, waste of time and inefficiency. In fact it was evident that the prosecution of the war was being slowed up as a consequence of the housing conditions.

Normal peace-time expenditure in the United States for workingmen's homes has been estimated at one billion dollars a year; in 1919 the war pressure cut down the expenditures for this purpose to ten per cent. of that amount. It was also found that restrictions upon building materials, the general scarcity and high cost of labor, the derangement of prices incident to the war and the consequent difficulty of securing building loans combined to discourage private investment. This condition made government aid imperative as a war measure.

The U. S. Housing Corporation was created to meet the crying need for relief and its function has not been merely to build houses for industrial workers, but also to provide houses for such work-

ers in every manner possible. The success of the efforts to keep workmen "on the job" by providing adequate living facilities is evidenced in industrial centers from coast to coast and from the Canadian line to the Mexican border.

The Housing Corporation has concerned itself not alone with providing homes in the immediate vicinity of great industrial plants. Where it has been found to advantage, the corporation has gone farther afield and where it has been cheaper and quicker to provide transportation facilities, between the industrial centers and more favorable housing communities, the corporation has met conditions by arranging adequate train, trolley or boat service. Frequently this has been done by furnishing financial assistance, properly secured, to existing transportation companies. In other cases, the corporation has arranged for commutation fares which enabled workers to live at a distance from their places of employment. Ferryboats have been chartered by the corporation for the benefit of the workers and other means have been evoked which enabled workers to get to and from their work in a reasonable time and at a reasonable cost.

The corporation also has made every effort to stimulate private capital to an interest in the housing shortage and has met with remarkable success along this line in a great many industrial centers where the demand for houses exceeded the supply.

One of the undertakings of the corporation was to compile a complete list in a number of the larger cities containing every factory employing more than ten men, including a statement as to the kind of work that the less essential factories could take on as a war measure and how long it would take these factories to change over from a peace to a war basis. In this way it was found that in many localities no extra housing would have to be provided if a certain percentage of labor was diverted from the less essential factories to those engaged in war work.

When it was found impossible to provide living accommodations by any other means, the Housing Corporation adopted its final method of meeting the demand by the acquisition of land and the construction of homes. In some instances this comprehensive method resulted in the building of entire new centers. However, before deciding upon the construction of such a "project," the corporation satisfied itself as to the industrial stability of the center and the probable existence of a normal population in non-war times. This was done in order to provide for the safety of the investment and to justify the permanent additions to local housing.

The wisdom of this policy of aiding in the construction of industrial housing has been shown by the fact that the mere announcement of the government's intention to build houses was sufficient to hold workers on the job, and that, as the work progressed there was a marked diminution in the labor turnover in that district.

A unique feature of the U. S. Housing Corporation's method is found in the management and operation of its houses. Its task is not finished with the completion of homes and the arrangement of transportation facilities. Having called its industrial towns into existence, the corporation is obliged to manage them to the satisfaction of the citizens, or tenants. For the multiform duties involved in this operation, a town manager is appointed. This official is, in fact, a hotel manager on a large scale, a real estate expert and a morale officer. He is responsible for the physical upkeep of the houses, the maintenance of sanitary conditions, the abatement of nuisance, the adjustment of those neighborly disputes which, unadjusted, lead to the police court, and for the general welfare and supervision of the population. The duties of the town manager also include the establishment and maintenance of desirable social and recreational activities; he is the energizer of community life.

On the score of architectural appearance there are lessons to be learned from the work of the Housing Corporation, both positive and negative, concerning the means by which small houses may be made beautiful consistently with economy of construction and convenience of use; but perhaps the most striking lessons in this respect concern the location of the houses and the general town planning. When long lines of houses on long, straight streets are imposed by an existing rectangular street plan, the houses being small and close together by force of economy, hardly any architectural skill can produce a thoroughly agreeable result, even by resort to grouping and to such variations in set-back as are normally acceptable to the occupants. The experience of the corporation has merely confirmed in this respect a generally accepted opinion of town planners that in residential developments, especially for small houses, comparatively short street vistas in proper scale with the houses are extremely important, whether secured by absolute discontinuity of the minor streets or by moderate curves or angles in them; and that such departures from the theoretical economy of the rectangular plan need not involve, if well designed, an appreciably greater cost per house for streets, utilities and land.

THAT there is no time to be lost in the solution of our housing problems, is shown by the recent report of the Housing Committee of the New York Reconstruction Commission. The conditions brought out in the report are in no way peculiar to New York City, but exist in every city and town in the country:

Abram I. Elkus, Chairman of the Commission, said recently:

"The intensive survey that has been made in characteristic parts of the city in which the poor of New York live, has made it apparent that a great part of the population of New York are dwelling in places in which human beings in a civilized country should not be forced to live.

"Next winter the scarcity of houses in New York City will be so great and rents will be so high, unless houses are built this season, that labor will be turned away and New York's business, industry and prestige will suffer.

"It is apparent that to meet the present emergency we must not only build more houses, but we must build better houses. The war-time experience of the government made it apparent that workmen go where they are able to find sufficient decent houses which they can afford. New York next winter is likely to experience an increased turn-over of labor just as did the munition and shipbuilding towns a year ago. But more than that, no one can tell to what extent the growing discontent among the tenants may lead to riots or worse.

"There is but one solution to the present emergency. It is to build more houses and build them at once.

"Building industries have been completely discontinued by the war and the speculative builder as well as lender, is afraid to take a chance at this time. They fear competition of building that may be erected at lower cost in the future.

"Insurance companies or other sources of large loans are unwilling to lend to the small speculative builder on the uncertain values of the present time. Building and loan associations cannot get sufficient financing on their low rate of interest.

"The fuller utilization of existing buildings by turning old single-family dwellings into multi-family houses and the repair of older tenements now partially out of use would result in most cases in the perpetuation of an undesirable type of housing. It would give a very limited increase in capacity; it would give so small a degree of relief that it cannot be considered a solution.

"As a matter of fact, the fundamentals of the situation are summed up in the reaching of new price levels during the war, and the uncertainty on the part of

all interests involved in building that these price levels are permanent or even likely to endure over a period of years, cause the lending institutions to refuse to recognize them at all.

"According to the U. S. Department of Labor, prices on building materials, not including steel, have increased 84 per cent., whereas other commodities have increased 113 per cent. When prices do stabilize the new value of the dollar is likely to be somewhat between the two.

"In building operations, 40 per cent. of the cost is for labor at the site in assembling the material; 5 per cent. is for freight; 35 per cent. is for labor in the mines and factories at the source of supply in the manufacture of the raw material; 20 per cent. represents raw material.

"As a matter of fact, under date of April 9, 1919, Thos. S. Holden, Division of Public Works and Construction Developments, U. S. Department of Labor, states: 'After a somewhat extended study of prices it is the opinion of the Division of Public Works and Construction Developments that a new price level has been established by economic conditions attendant upon the world war.'

"No matter what opinions may be as to the possibilities of a decrease in the cost of building materials there are few who are of the opinion that the cost of Labor will decrease.

"Since the stoppage of buildings by reason of the war, the city has spent several hundred million dollars on rapid transit lines which have been put into operation and have made available in the boroughs outside of Manhattan a large amount of cheap land, where people can live and go to and from their places of business in moderate time. This cheap land will offset to some extent the increased cost of construction.

"It is believed that a large building operation should be undertaken for the purpose of demonstrating that building, if carried on properly, is safe at the present time and will pay a reasonable return; and by starting such building the speculative builder may be encouraged to again re-enter the market.

"This would create a much-needed opportunity to break the deadlock in business and especially in the building industries. Apparently all of the studies show that the building industries are the key to the business and unemployment situation.

"It has, therefore, become apparent to us that relief must be sought by the stimulation in the ordinary channels of business to build more houses at once; but we are equally convinced that the mere stimulation of building would be effective only if it were safeguarded with the proviso that buildings erected with co-operation of the plan we propose, must

conform to definite standards of improved light, air and construction. Assurances have been received from the building world that if a program could be started the business of building will readjust itself and confidence will be re-established, and thereupon an independent program of individual initiative will go forward. Builders and money lenders are apparently all waiting for something and a deadlock exists. Courage is needed, and we are therefore of the opinion that a program can only be started if new sources of financing are found. Our commission has, therefore, worked out definite proposals, based on definite figures. It needs the co-operation of the public to make it a success. Our figures have convinced our Housing Committee and its advisory group of experts that a housing finance corporation, with a large capital, can immediately erect buildings that can be rented at moderate rentals.

"The big function of a Reconstruction Commission at this time is the re-establishment of the confidence of the people in their ability to carry on business. The Commission has attempted to do that from various angles. It is convinced that fundamentally the opening up of the building industry and the re-establishment of it on a sound basis is going to complete the economic circle by providing not only the needed new home, but also by bringing about a readjustment of the employment situation, which is so essential at the present time. The whole thing is a problem of the transitional period, the real reconstruction period between the end of the war and the permanent peace, which all countries have to approach, and we have to approach this one thing right here in New York City. Somebody has to take up the slack—the state cannot. We believe there is no greater public duty than just the re-establishment of that business confidence through the opening up of building activities. We, therefore, propose that the citizens of this state shall not rely upon the state or the city with its constitutional limitations, which would mean several years to overcome. We think there is enough enterprise in the merchants and capitalists of the city of New York to take care of this problem and to take care of it immediately, to enable the people to find homes and the unemployed employment."

The concrete plan proposed for New York is summarized by Alfred E. Marling. Mr. Marling says:

"We have taken the usual type of so-called new law tenements, covering 70 per cent. of the land, having most of its rooms lighted from narrow courts, 6 feet wide, and compared it with studies of an improved type covering 37½ per cent.

of the land with courts 32 feet wide, all opening on a large open-air, inner court playground.

"With the same cost per room to the tenant, the old type of construction gives smaller return to the owner, costs him more to operate, and gives the tenant less air, less light, and no play place but the streets for the children.

"The new type which we proposed gives greatly increased light and air to every room, gives sufficient and safe outdoor play spaces for the children, and, at the same cost to the tenant, gives the owner with less or his land space occupied a better return on his money.

"The economy of these operations can only be demonstrated in large operations, such as block square units. Small unit building will not relieve the present shortage, or be as economical or as sure in return as the larger scale. The maximum social benefit is also only to be secured from the large unit.

"With a fund of \$5,000,000, we can house approximately 18,000 to 20,000 persons, or 4,500 family units, about one-fifth of the present shortage, to say nothing of the shortage we will face in the fall.

"We can rent at \$8 to \$9 per room per month, so that a 4-room apartment can be had at from \$32 to \$35 a month. These prices are based on figures secured by taking comparative bids on various items entering into construction costs. These indicated an increase of approximately 50 per cent. over pre-war prices. A similar study made by the Department of Labor of the U. S. of certain types checked our figures accurately.

"Our figures also show that allowing for taxes, cost of operation, management, mortgage interest, insurance and amortization there will still be a return to the ownership of 6 per cent. or more.

"The New York investigation brings out the usual conflict between those who would encourage private initiative and those who would fall back on government or municipal housing projects. These latter, in most cities, cannot be made effective immediately because of constitutional limitations in municipal debts.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

The "Builders' Guide" is in its thirty-third year of continuous publication.

## This Motor Truck Secured Them the Contract

ONE of the coal and building supply houses of Philadelphia had an opportunity to bid on hauling sand, stone and gravel to this building operation.

They found their Autocar Motor Trucks could do the work at a profit, because a trip that would take two hours and a half with horses was less than an hour's work for an Autocar.

For six years they have been Autocar users, and have continually found they could secure contracts that were out of the question before.

*Autocar Motor Trucks are doing the hauling for more than 7000 concerns in over 450 different lines of business. Write for a catalog and a list of Autocar users.*

## Lumber and Service

"Job lots and bargains are all right when you are buying collars or shoestrings," said the Old Man to his junior partners, "but if we decide to build this year, I want to know beforehand who is going to furnish the lumber. If this new addition is to be finished by winter, we shall need something beside flooring and shingles—we have got to have SERVICE."

And so the Old Man insisted that all the lumber should come from Lloyd—for he had had experience; he had paid a high price for it.

Can you make use of his experience in your building plans, or do you feel that you must have some fresh experience of your own?

The illustration shows the installation of the famous "Star" Ventilator on the War Trade Board Building, Washington, D. C.

## "STAR" VENTILATOR (Patented)

The "Star" Ventilator was adopted by the U. S. Government as its War Standard for cantonments and other important buildings, on account of its HIGH EFFICIENCY and SIMPLICITY.

The Thousands of "Star" Ventilators in use on public buildings, schoolhouses, mills, warehouses, and similar structures throughout the country, proves their superiority over other types.

We also manufacture Evans "ALMETL" Fire Doors and Shutters, Metal Tiles and Shingles, approved by the U. S. Gov., and High Grade Roofing Tin.

### An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

### ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

## As The Editor Sees It

**S**ATISFACTORY progress is being in overcoming war-time problems and establishing normal conditions as regards the management of big buildings was the consensus of opinion at the twelfth annual convention of the National Association of Building Owners and Managers, held last week in Philadelphia. Discussion of apartment houses indicated the great increase in demand for high-class apartments, enormous rentals being paid for such apartments in the large cities.

Any indication of the approach of normal conditions is most welcome, but normal conditions must not be construed to mean pre-war conditions.

Roger W. Babson, Director-General of the Information and Education Service of the Department of Labor, has obtained opinion on this subject from such representative men as T. Ogden Armour, Major-General Goethals, John Hays Hammond and others. Firm conviction is expressed by all that the level of pre-war prices will never again be reached in this country.

"The greatest danger to our economic structure today," said J. Ogden Armour, "arises from the failure of many to recognize a new and higher level of prices based on permanently increased cost of labor, and high taxation."

Major-General Goethals declared that the immediate problem confronting the country was the resumption of business, including, particularly, building construction, manufacturing and mining.

The one pre-eminently outstanding fact, General Goethals said, was that there can be no return either to pre-war condition or pre-war prices.

That prices will not soon drop is the prediction of authorities on all sides. The Federal Reserve Board in its May bulletin says: "The business community has given up the thought that it may profitably await a further considerable reduction in prices and is now contenting itself with the development of trade along lines dependent upon at least the temporary maintenance of existing levels." The review also says that though prices of a few basic commodities have fallen slightly, these declines have not yet been effected in retail prices. "What is now happening," it adds, "seems to indicate that business will, after a period of initial readjustment in prices, proceed upon a level not far removed from that established during the war."

At the solicitation of the Information and Education Service of the United States Department of Labor, J. J. Arnold, Vice-President of the First National Bank of Chicago, has made a statement on "Inflation and Prices," in which he says it is futile for industry to wait for pre-war commodity prices and everything should be done to encourage resumption of peace business, the production of new wealth being absolutely essential for the reduction of costs.

\* \* \*

An interesting letter has been sent to

its customers by the Leader Iron Works, Decatur, Ill., of which T. E. O'Brien is President. It is intended to be a fore-warmer of a possible rise in prices of steel products and predicts an advance during the midsummer months.

The writer takes an optimistic view of the price situation and states that it would be unreasonable to expect steel to go down to pre-war prices while all the machinery, raw material, buildings and everything that has to do with the making of steel is governed largely by the cost of labor which has increased from 125 to 150 per cent. The present average of iron and steel prices is 30 per cent. above the ten-year average prevailing prior to 1914 and the present scale of wages is, as quoted, 125 to 150 per cent. higher than the ten-year average for the same period.

"Farmers," says Mr. O'Brien, "don't want wheat or other farm products to go down, and when analyzed we are not sure but that it is best to keep prices up for a while—keep everything that is bought and sold on a higher price level. Why not? Everyone likes to handle a large sum of money better than a small amount. If a laboring man wants to work an hour for a dozen of eggs and likes it, why not let him do it? If the rich are satisfied to pay a heavy income tax, luxury tax, and a half-dozen other taxes, let them pay. What's the difference? After all, isn't it a fact that conditions, prices and people finally adjust themselves to the times?"

KEYSTONE PHONE, RACE 614

**BLUE  
PRINTS**

The large iron and steel mills of the country are now considering a price advance as will be seen by reference to the financial and business review in the current issue, and not until the rest of the world is again established on a productive basis that will increase the supply of all the necessities of life and reduce the cost of labor can a reduction in the prices of basic materials be expected.

In view of these facts the retail dealer who delays in placing his orders with manufacturers will find himself at a disadvantage. The public has plenty of money and is willing to spend it for good articles, and the man who neglects to make ample provision for big trade will not be able to run his business very long with profit to himself or satisfaction to his customers.—*Manufacturers' News*.

the store and the furniture itself. So it is in every industry, even that of agriculture.

We forget what it means to have an under-built nation of more than a hundred million people. We cannot conceive the fact that for every hundred homes that stand at least one more has to be built before the country's construction program can attain even a normal condition. In peace time, for instance, marriage alone calls for more than 100,000 new homes a year and for almost two years two million men have been too busy with Uncle Sam's affairs to do much more than *think* about getting married. In prosperous times the country erects almost half a million structures a year, but in the last two years, this volume of actual building outside of Government needs has been shrunk to almost nothing, yet people in that time had not given up hope of building. Therefore all that construction will soon or later proceed to actuality because the American people have the money either in the banks or in Liberty Bonds. The American people are richer today than they ever have been and the degree of a man's success is often counted by the fact of whether or not he "owns his own home."

In all your experience have you ever known a time when the subject of housing is as acute as it is at present? It is a subject of every-day discussion everywhere. When there is a known demand for a thing can you recall a time when it was not supplied? What more essential thing is there than shelter? What better financial investment is there than the improvement with a building of a part of the land that Uncle Sam's boys, some of your sons themselves, maybe, went out to protect against a hostile horde?

The whole country looks upon the builder as the peace time soldier, the Marine of Industry because he is the first to show the way—and he's started.

Four years ago a farmer sold 150 hogs to build a home costing \$2900. Recently a neighbor sold the same number of hogs, built a replica of the house and put \$5388 in the bank. This probably is one of the most forcible illustrations of the fact that building materials have advanced less than any other commodities on the American market. Recent figures of the United States Bureau of Labor Statistics show an advance of 57 per cent. in building material, whereas food, clothing, house furnishings, etc., have scored far greater advances. It is time now to build the home. Delay will mean only a higher cost.—*Rocky Mountain News*.

## THE BUILDER AS A BOOSTER

BY ALLEN E. BEALS

The Builder Must Know Why Prices are High and Why Prices are Likely to Advance if he Wishes to Convince his Customers it is Wise to "Build Now"

**B**UILDERS should be in a position to prove to their customers that they need wait no longer. All the investigating has been done that can be done, and we are down to the solid fact that materials are short and the demand is immense.

Builders cannot start things by themselves, as a rule. Those who can—the biggest ones—are going ahead as fast as they can secure the capital, in what ordinarily would be called speculative building—but a sure thing under present and future conditions.

Generally speaking, the builders themselves are not fully convinced of the wisdom of the urge to "Build Now," and consequently make a poor job of convincing their clients—prospective home owners—that there will be no time so good as the present to get that building under way.

It is significant, however, that many builders are building for themselves—which shows that these men are believers and not doubters. They are "bulls" in the market. Those who have purchased lots and own their own homes, are putting up two and four family apartment buildings, and getting ready to move into one of the apartments and rent their present homes, sometimes remodeling these into two apartment or duplex dwellings. These men are practical boosters—"bulls" on the United States.

They give an object lesson to their customers by taking their own medicine.

You cannot lose if you are a "bull" on the United States. That is one of J. Pierpont Morgan's maxims, and it never failed him.

There is no business closer to the verge of unprecedented prosperity than is the building industry today. In fact one foot is already over the line and almost every other business hasn't even started. The causes are at least interesting to follow.

The United States is the world's creditor nation. This means one thing: Industrial Expansion. Before any other business can get fairly started it must have an office and a factory. Almost at the same time it must have adequate railroad facilities. What good is plenty of ships if factories are unable to manufacture goods enough to fill them? The railroads have not been developed during war time to take care of this tremendous world trade so the next important thing is to have enough warehouses to stock the goods awaiting shipment. Changing about of labor has made housing scarce. More houses mean better schools, more churches, bigger institutional buildings. More houses mean more roads and more roads mean the ultimate erection of houses on the land development plan.

What does it mean to be a "Creditor Nation." The simplest explanation is that more than half the money we have spent for the war will be returned to us in the form of investment funds. This money will go into industrial securities, railroads and municipal and national bonds. Wherever it goes its chief use will be diverted to construction of one sort or another at first. It will be used to purchase new machinery. New machinery means larger factories. Larger factories mean more hands to operate the machines and handle the finished products and those employees must be housed, not in any sort of a shanty, but in a better house than they had before the war because they can afford better homes.

Every new house that goes up represents a certain sum spent for finishings. That means that the cabinetmaker and the furniture man will have to enlarge his plant and the wielder of the hammer and the saw and the chisel will find all he can do both inside and outside in building the factory, the office building,

**Stores (2) (alts.),** 1514-16 Market street,

## Lumber and Service

In a building operation everything must be on the spot at the right time. The first thing you need is SERVICE. The finest flooring in the world is of no use if when the men come to lay it you find it is stuck in a freight jam at Norfolk, Virginia.

The right kind of service avoids freight jams. When Uncle Sam was building, he called on us to help keep his lumber cars moving. So we have had a post-graduate course.

Fifty years' experience is at your service when you build, if you see that the lumber comes from LLOYD.

**WILLIAM M. LLOYD COMPANY**

Established 1868

29th and Ridge Avenue

PHILADELPHIA

Philadelphia, \$3,000. Architect, private plans. Owner, David Becker, on premises. General alterations, new fronts. Contract awarded to Smith-Hardican Co., 1606 Cherry street.

The illustration shows the installation of the famous "Star" Ventilator on the War Trade Board Building, Washington, D. C.

## "STAR" VENTILATOR (Patented)

The "Star" Ventilator was adopted by the U. S. Government as its War Standard for cantonments and other important buildings, on account of its **HIGH EFFICIENCY** and **SIMPLICITY**.

The Thousands of "Star" Ventilators in use on public buildings, schoolhouses, mills, warehouses, and similar structures throughout the country, proves their superiority over other types.

We also manufacture Evans "ALMETL" Fire Doors and Shutters, Metal Tiles and Shingles, approved by the U. S. Gov., and High Grade Roofing Tin.

### An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

### ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates. Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

## As The Editor Sees It

THE price situation continues to be a topic of absorbing interest. Some very illuminating facts pertinent to this question were presented by Professor Thomas S. Holden to the Committee on Public Utilities of the Chamber of Commerce of the United States. The sooner the public accustoms itself to the prevailing high prices, the sooner it realizes that any great and immediate reduction is both impossible and entirely undesirable, the better will America be able to fulfill the demands of after-war business conditions.

"One of the factors," says Professor Holden, that has tended to delay building operations has been the tendency on the part of bankers to refuse advances of money on the basis of valuation computed in terms of present prices of materials. It is hoped that the statement of the Federal Reserve Board will influence the bankers to pursue a more liberal policy.

According to figures of the Bureau of Labor Statistics, the maximum level of wholesale prices of basic commodities was reached in September, 1918, the index figure being 207. This figure is based on the average for the year 1913 as 100. The index figure for the month of February was 197, for the month of March it was 200, for the month of April it was 203. Weekly quotations continue to show more commodities advancing than declining. Thus it is seen that the price level is again within hail-

ing distance of the maximum. The question today is not whether prices will fall or how much they will fall; it is rather how much higher will they go? The principal commodities that have advanced recently are foodstuffs. Although there is a surplus in this country, there is a world to be fed and the world supply is short. Mr. Herbert Hoover has been quoted as stating that wheat would probably go to \$3.50 a bushel if all restrictions were removed. The cost of living is still increasing and the dollar is on the decline. The problem is to arrest this decline in the purchasing power of the dollar.

People want to know today what future prices are likely to be. It is impossible to prophesy, but it is possible to view facts that will have a bearing on future prices. From these facts it may be possible to indicate future price tendencies.

It took thirteen years after the Civil War for wholesale prices to get back to the pre-war level. The circumstances of that period were much more favorable for price reductions than they appear to be at the present time. As compared with the war just ended the Civil War was a purely local affair.

The reason why the present situation has been so difficult to understand is the fact that it is a world-wide phenomenon. The scope of the economic changes has been as wide as the war itself. In January of this year the Bureau of Labor

Statistics' index figure for wholesale prices of all commodities showed an increase of 102 per cent. over the year 1913. At the same time the price level in England was 117 per cent. higher than in 1913; in France it was 249 per cent. higher. It is a significant fact that France, which showed such a marked rise in the price level, resorted to inflation to a much greater extent than did either England or the United States.

In England and in America it has been considered wise to pay a large proportion of the expenses of the war through the levying of heavy taxes, thus minimizing the necessity for extension of the public debt and the inflation of currency. In those countries where it was considered expedient to avoid high taxation and to resort to inflation the people are now paying the piper through the high prices they are obliged to give for the necessities of life.

Whether you believe with the majority of economists that the price level is the result of the amount of money, or whether you agree with the minority that that the quantity of money accommodates itself to the price level, the present condition of world-wide high prices accompanied by a world-wide increase of money and credits, must be considered. Either prices in the future will be less because of a contraction in the amount of legal tender, or lower prices in the future must be accompanied by a decrease in the amount of legal tender.

PRINTS**

Hence the problem of future prices depends upon the solution of the financial problem and a solution of that cannot be wholly controlled by any one country.

Lord D'Abernon, an eminent British financier, has been quoted as follows: "If there were to be an attempt today to bring about a rapid return to the gold currency basis of 1914 it would almost double the weight of the world's indebtedness and would certainly lead to the bankruptcy of many nations." The governments which have borrowed cheap money would, in the case of contraction, have to re-pay with dear money. Individuals who have borrowed cheap money would have to pay back with dear money. The inevitable heavy taxes would have to be paid in dear money. It is extremely unlikely that the governments of the world can be reasonably expected to decrease appreciably the world inflation within a brief period of years.

The condition that have brought about inflation and the rise in the price level in this country could only have been avoided if all trade regulations with Europe had ceased at the outbreak of the war. What has happened has been that we have shipped enormous quantities of goods to Europe. Those goods have not been used in production, but have been consumed or destroyed. We have received in return, not goods, but money. These transactions, in the aggregate, have approximated fifteen billions of dollars. Before the war this nation was indebted to Europe to the extent of six billions. We are now Europe's creditor to the extent of nine billions.

A serious problem at the present time is concerned with conditions surrounding future trade relations with foreign countries. If America continues to ship goods to Europe, receiving in return only money or promises to pay, there is danger that the disparity between the amount of commodities and the amount of money in this country will continue to grow, resulting in a level of prices even higher than that obtaining at the present time. In view of this, some people think today that it may become advisable to restrict exports to such an extent that they may be paid for in commodities rather than in money. Such a regulation could scarcely be put into effect all at once. It might not be practical at all. It would appear, however, that Europe's debt to us must ultimately be paid in goods.

Any consideration of future prices must necessarily involve a consideration of the probable tariff program. Without going into the controversial aspects of this subject, it is well that those phases of it which are likely to affect prices be noticed here. It is a serious question whether it is desirable that a tariff schedule be framed in such a way that we

shall continue to ship goods away and receive in return only money or promises to pay. What used to be considered a "favorable" balance of trade, may not be so "favorable" in the future. The ideal condition in foreign trade is the exchange of commodities for commodities, money being used merely as that which facilitates the exchange. It is true that it would not be desirable to have foreign goods sold in this country in such a way as to demoralize our markets. It is none the less true that we do not want further increases in our stock of money to such an extent that its purchasing power will continue to decline.

This problem is engaging the serious attention of some of the best informed leaders in business, economics and statecraft. It is to be hoped that their reasoned opinions will have a great influence on our future tariff policy. Even though past tariff policies may have been successful, any new policy must be framed after thorough consideration of a large body of new facts. A wise program cannot be expected if it is made solely as a compromise between the claims of short-sighted, selfish interests. It cannot be expected if the problem is viewed only in the light of before the war.

There are many far-sighted, thoughtful men among our leaders of business and our public men. There are men expert in this intricate subject among our practical economists. It is to be hoped that the ideas of these groups will prevail.

Although foreign trade relations have been so largely responsible for the conditions we face at present, and though these relations may be of great importance in the future, it is possible to concentrate too much upon the problems they involve. These problems can not be settled at once. France has been obliged to await the settlement of the Peace Treaty, and has deemed it expedient to place drastic restrictions on imports during the waiting period. Great Britain has raised the barriers against foreign goods for the duration of such time as is necessary to get her industrial house in order. The period of readjustment in Europe must be necessarily prolonged.

In the meantime, should the people of the United States sit idly by and watch their dollars shrink? Must prosperity wait until foreign markets are opened to us? When the wheels of American industry are turning and every able bodied worker has a job that brings him a substantial wage, there is a pretty extensive market for American goods among the one hundred and ten million people of America. The best way for Americans to set about arresting the shrinkage of

the dollar is to produce more goods, thus remedying the existing disparity between commodities and money.

Great as is the actual and potential demand in this country for consumers' goods, perhaps even more insistent is the demand for houses. In the words of Walt Mason, the poet laureate of Kansas:

"In my native burg, Emporia, I see women chasing round, and they tell the same old story—houses simply can't be found. And the same sad word is spoken everywhere I chance to roam; from Topeka to Hoboken folks are hunting for a home."

The nation's shortage has been estimated at one million houses.

There should be plenty of money available for building enterprises. During the period of waiting there was plenty of it to spend on diamonds and silverware and jewelry of all kinds. There has been plenty of it to spend on automobiles. Great increases of sales of cigars have been reported. Little difficulty has been experienced by those who wished to finance the purchase of numerous quarts of Gordon Gin and Haig and Haig against the long dry spell to come.

In short the public has been willing to spend its money on luxuries, but unwilling to invest it in building, which is a vital necessity, and which increases the permanent wealth of the country.

At the beginning of the year the building of homes was urged on the grounds of patriotism. At present, it is an absolute necessity that they be built to fill all urgent need. Furthermore, in the light of present information concerning prices, it can be shown that money spent on building is money well invested.

Considered in relation to prices prevailing in the year preceding July, 1914, building materials are cheaper now than most other commodities. By the end of 1918 lumber had advanced 73 per cent. above the pre-war level; mill prices on Portland Cement has risen, on the average, 74 per cent. f. o. b.; plant prices on mineral aggregate (sand, gravel, and crushed stone has risen on the average, 73 per cent.; building stone on the average, 64 per cent.; common brick, 92 per cent. The building materials group (not including any metal products) rose 84 per cent. Compare this with a rise of 113 per cent. in all other commodities, and with a rise of 116 per cent. in the group of farm products. The cost of construction of buildings on the average has increased about 62 per cent.

Little evidence is in sight pointing to a decline of prices in general. There is even less likelihood of declines in prices of building materials. The index for

the group was the same for the first quarter of this year as for the last quarter of 1918. Slight declines in some materials have been offset by slight advances in others. As a group the prices have been practically stabilized.

In the nature of things, prices of building materials fluctuate less than the prices of those commodities which are consumed from day to day, such as food-stuffs, and textiles, and of those commodities such as the metals, which furnish the raw materials of industry. During the Civil War building materials advanced less rapidly than did other commodities, and they failed to reach the high levels of other commodities. In fact they remained above the general level of all commodities until 1874. If building materials, instead of fluctuating in price, had declined from the high point of January, 1865, at a uniform rate of 4 per cent. per annum until 1874, they would have reached their actual 1874 level, which was the same as the general level of all commodities for that year.

A decline of 4 per cent. per annum in prices of materials would probably not involve an annual depreciation in value of a building of more than 2½ per cent. The fact is that present conditions do not indicate that the next few years will see declines in building material prices amounting to as much as 4 per cent. a year. It is more than likely that building materials, on the average, will not decline at all for a considerable period. Present indications are that building materials are more likely to be somewhat higher on the average in 1920, than at present, rather than lower.

Not only is the demand for houses imperative and the cost of construction cheap in proportion to prices of commodities in general, but there is every prospect that the return to those who invest in building now will adequately cover present construction costs.

\* \* \*

The New York Joint Legislative Committee, through its chairman, Senator Charles C. Lockwood, is urging exemption from Federal taxation of mortgages or holdings in mortgages on buildings. The belief is expressed that if this exemption is provided mortgage money can compete in the money market with government and other securities which are now non-taxable.

Taxation tends to restrict output. Taxes on buildings could be made so heavy that building operations would cease. We tax dogs to keep down the dog population. No one denies that to tax a given article is to penalize production of that article; to tax houses is to penalize the building of houses.

The dire need for dwellings and apartments throughout the country is justifi-

cation for the most radical action which will encourage building. It may be that as a nation we have a prejudice against anything resembling discrimination. The thought of exempting new buildings from taxation goes against the grain of our traditions, but we are confronted by a very serious situation and the conventional ways of handling building activities do not promise the relief essential.

Since we need buildings rather than building sites, and since taxes tend to restrict the supply, it might be worth while to increase taxes on vacant building sites, and decrease taxes on buildings. High taxes on building sites would tend to force the owner either to sell to someone who would improve the site or improve it himself in order to make it produce revenues.

Whether or not we interest ourselves in the building site phase of the ques-

tion it is imperative that conditions be made as favorable as possible for new structures and the investment of money in new buildings.

If present conditions continue for any length of time, of necessity the Federal Government will be forced to devise ways and means of financing new building projects. In that event and to whatever extent it goes in for Federal finance, it is deprived of tax revenues on the money. It has nothing to lose, therefore, and much to gain, if it will now devise a way to favor private initiative in building investments through tax exemptions.—*American Contractor.*

#### PERSONAL NOTES

George S. Idell, architect, formerly at 34 South Sixteenth street, has moved his offices to larger quarters at 1705 Chestnut street, Philadelphia.

## THE HOME OWNER'S INTEREST IN CITY AND TOWN PLANNING AND EXPANSION

PERRY R. MAC NEILLE

ONE of the interesting features of the reconstruction period which follows a great war is the resumption of business activities along extended and more carefully considered lines. During the war period, there was a slack in normal every-day business. Popular interest in the war has had its effect in broadening the viewpoint of the average man, and in the placing of industry and commerce again on a peace basis, it has been the aim of every individual and corporation to create a more efficient and broader form of organization.

The mind of a city is constituted of the collective minds of its citizens. Cities, therefore, are being considered from a broader viewpoint and placed on a business basis in a manner never before known. The average city is being considered by its citizens and its officials more as a business institution and the taxpayer is taking a more constructive interest in city activities. As a business institution, the average city is feeling its lack in many ways, and broad programmes are being outlined, having as their purpose the intensive development of present sources of city revenue, the addition of new sources of municipal revenue and a study of the expenditure of city funds in order that greater results may be enjoyed by the citizens upon whom the burden of taxation falls directly.

The purpose of this article is not to consider directly the problems of any individual city or town, but to outline in a

general manner the intent and purpose of city and town planning, the problems which are involved and methods of solution which will be beneficial to the city and its inhabitants.

The modern city planner should not, and does not, approach the problem of a city with a view of providing a picture of a city beautiful; a picture which may be attractive as it hangs on the wall, but which in its actual carrying out may be impracticable and may involve an expenditure too great for the average city to bear. The city practical is inherently a city beautiful, and from this viewpoint it may easily be realized that a city plan means a graphic presentation of the various factors involved in a logical municipal expansion program, indicating not only proper and inexpensive changes in existing conditions in built up sections of the city, but clearly defining and directing methods of expansion for the years to come. Following are the principal features of an ordinary city plan, and these will be explained in detail in later paragraphs.

1. Present city plan with recommended changes at bad traffic points and recommendations for the location of new public and semi-public buildings, including railroad stations, hotels, theatres, churches and institutions.

2. On this plan will be shown logical extension of highway and street systems and traffic bridges in undeveloped territories which will be utilized as the population grows.

**Dwellings (2)**, Houghton street, North of Walnut lane, \$4,000. Architect, private plans. Owner, Elwood Barrett, 538 East Walnut lane, Philadelphia. Brick, 2 stories, 15x51 feet, asbestos roof, hot water heat. Owner will build.

**Garages (3)**, East side Sixtieth street, South of Baltimore avenue, \$16,500. Architect, private plans. Owner, Edward V. Holland, 1037 South Fifty-fourth street, Philadelphia. Brick, 1 story, 82x37 feet, 39x20 feet, gas, electric light. Owner will build.

**Dwellings (20)**, Fifty-ninth and Larchwood avenue, Philadelphia, \$90,000. Architect, private plans. Owner, W. Pilton, 5957 Larchwood avenue, Philadelphia. Brick, 2 stories, 15½x42 feet, 12x11½ feet and 16x42 feet, 12½x11½ feet, slag roof, hot water heat, electric light, hardwood floors. Owners will build.

**Traffic Stable (alts.)**, Broad street below Federal street, \$6,000. Architect, Joseph A. Roletter, City Hall, Philadelphia. Owner, City of Philadelphia, Department of Public Safety, Philadelphia. General alterations, slag roof, plastering, mill work, painting, plumbing, electric lighting. Owners taking revised bids due July 2nd. J. H. Jordan, Thirty-first and Oxford streets; Bowden Const. Co., 1713 Sansom street, and Monaghan & Losse, Inc., 3016 Chestnut street; E. C. Durell, 1713 North Twenty-fourth street, figuring.

**Residence (alts.)**, Broad and Courtland streets, Philadelphia. Architect, H. W. Castor, Stephen Girard Building, Philadelphia. Owner, Dr. S. Goldberg, 4415 Germantown avenue, Philadelphia. Rearrangement of office, partitions, mill work, etc. Plans in progress.

**Moving Picture Theatre**, 4910 North Broad street, Philadelphia. Architect, Albert Schenek, Real Estate Trust Building, Philadelphia. Owner, Logan Auditorium, on premises. New front add., reinforced concrete, ornamental terra cotta, 40x50 feet, slag roof, cement and composition floors, leaded glass (heating and lighting reserved). Architect taking bids due June 30th at noon. A. R. Raff Const. Co., 1635 Thompson street; Wm. R. Dougherty, 1610 Sansom street; H. E. Baton, 1713 Sansom street; Jacob Myers & Sons Co., Witherspoon Building, and L. T. West, 828 Broadway, Camden, N. J., are figuring.

**Garage**, Glenwood and Columbia avenues, Philadelphia. Architect, Waldemar Mortensen, 209 West Seventy-sixth street, New York City. Owner, American Ice Co., Sixth and Arch streets, Philadelphia. Brick, stone and steel, 2 stories, 75x75 feet, slag roof, stone foundations, waterproofing, iron work (heating and lighting reserved). Owners taking bids due June 26th. H. E. Baton, 1713 Sansom street; Monaghan & Losse, Inc., 3016 Chestnut street, and P. Haibach Const. Co., Twenty-sixth and Thompson streets, are figuring.

**Residences (34 additional)**, Sixty-fifth street between Lebanon and Diamond streets. Architect, E. Allen Wilson, 1208 Chestnut street,

Philadelphia. Owner, John J. Marshall, 1115 Marlyn road, Philadelphia. Stone, 2 stories, 16x45 feet, garages in basements, slag roof, slate roof, oak floors, hot water heat, electric and gas light, tile and marble work, gas ranges. Owners ready for sub-bids.

**Elevated Station (4)**, (1) York street, East side of Front, (1) Dauphin, West side of Front, (2) Girard avenue. Architect, private plans. Owner, City of Philadelphia, Department of City Transit, Mershon Building. Brick, steel and concrete. Plans completed. Owners will take bids in a few days.

**Twin Residence**, Queen Lane Manor, Philadelphia. Architects, Hawley & Hawley, 34 South Seventeenth street, Philadelphia. Owner, Queen Lane Land Co., Witherspoon Building, Philadelphia. Brick and rough cast, 2½ stories, 40x50 feet, slate roof, oak floors, stone foundations, hot air heat, electric light, tile work. Plans in progress. Architects will be ready for sub-bids in a week.

**Garage**, Queen Lane Manor, Philadelphia. Architect, Samuel D. Hawley, 34 South Seventeenth street, Philadelphia. Owner, W. C. Huber, Queen Lane Manor, Philadelphia. Brick, 1 story, 20x20 feet, slate roof, cement floors, stone foundations, hot water heat, electric light. Plans in progress.

**Garage**, Hunting Park avenue, West of Broad street, Philadelphia. Architect, Frank E. Hahn, 1112 Chestnut street, Philadelphia. Owner, M. Haisfield, 19 South Third street, Philadelphia. Brick, 1 story, 74x150 feet, built-up roof, cement floors, stone foundations, vapor system heat, electric light, tile and marble work, rolled steel sash, metal lath, iron work. Architect taking bids due June 30th. Wm. R. Dougherty, 1610 Sansom street; Smith-Hardican Co., 1606 Cherry street; E. E. Hollenback, Inc., 1804 Brandwine street; J. Sims Wilson Co., 1125 Brown street, and B. Bornstein, 1510 North Franklin street, are figuring.

**Bank Building (alt. and add.)**, 1645 North Broad street, Philadelphia. Architect, Paul A. Davis, 3rd, 1713 Sansom street, Philadelphia. Owner, Tenth National Bank, 1645 North Broad street, Philadelphia. Brick, stone and steel, 2 stories, 80x110 feet, slag roof, tile and oak floors, steam heat, electric light, tile and marble work, stone foundations, metal lath, kalamein doors, metal lath, roof ventilators, iron work. Architect taking bids due June 30th. J. Chas. Yundt, Tabor road, Olney, Pa.; H. H. Broeklehurst, 512 West Norris street; F. L. Hoover & Son, 1023 Cherry street; A. R. Raff Const. Co., 1635 Thompson street; H. E. Baton, 1713 Sansom street; John N. Gill & Son, Otis Building; Melody & Keating, 1322 Race street; Henry P. Schneider, 3713 Old York road; Cramp & Co., Denckla Building; Wm. R. Dougherty, 1610 Sansom street; Ketcham & McQuade, 1029 Brown street, and F. E. Wallace, 1220 Chancellor street; Thos. C. Trafford, 1613 Sansom street;

Frank G. Stewart, 1619 Sansom street, are figuring.

**Stores and Dwelling (6)**, Fifth street, South of Chew street, Germantown, Philadelphia, \$36,000. Architect, private plans. Owner, Jacob Faust, 4611 North Broad street, Philadelphia. Brick, 2 stories, 16 feet 4 inches x29 feet, 12x18 feet, slag roof, hot air heat, electric light, yellow pine floors. Owner will build.

**Building (add.)**, Northwest Corner Thompson and Clementine streets, \$10,000. Architect, private plans. Owner, General Machine Co., on premises. Brick, 2 stories, 50x147 feet, slag roof, electric lighting. Owners will build.

**Garage**, 199 Green Lane, Manayunk, Philadelphia. Architect, Frank V. Nickels, 4400 Manayunk avenue, Philadelphia. Owner, Jas. P. Seery, on premises. Brick, 1½ stories, 15x52 feet, slag roof, cement floors, steam heat, electric light, stone foundations. Owners will build.

**Dwellings (16)**, Pulaski avenue and Apsley street, \$105,000. Architect, private plans. Owner, John H. McClatchey, Land Title Building, Philadelphia. Brick, 3 stories, 16x40 feet and 16x32 feet, 8x12 feet, slag roof, hot water heat, electric lighting, oak and pine floors, cement work. Owner will build.

**Factory**, Fraley street, west of James street, Philadelphia, \$25,000. Architect, Stanford B. Lewis, Fifteenth and Walnut streets, Philadelphia. Owner, Abrasive Co., on premises. Brick, 2 stories, 61x95 feet, steam heat, electric light, concrete and maple floors, Warren Ehret roof. Owner will build.

**Apartment House**, Forty-fourth and Walnut streets, Philadelphia. Architect, D. Knickerbocker Boyd, Otis Building, Philadelphia. Owner, P. Teti, Tenth and Catharine streets. Brick, 3 stories, slag roof, pine floors, stone foundations, hot water heat, electric light, tile and marble work. Owner will build.

**Bank Building (alt. and add.)**, 713 Chestnut street, Philadelphia. Architect, Adin B. Lacey, 1012 Walnut street, Philadelphia. Owner, Bank of Commerce, 713 Chestnut street, Philadelphia. Brick work, structural steel, mill work, carpentry, painting, plastering, hardware, 19x25 feet, 1 story, cork and tile floors, electric lighting, marble work, iron work. Architect taking bids due June 26th. R. C. Ballinger & Co., 218 North Thirteenth street; F. E. Wallace, 1220 Chancellor street, and H. E. Baton, 1713 Sansom street; Lam Building Co., 1001 Wood street, are figuring.

**Residence (alts.)**, Pine street, Philadelphia. Architect, E. N. Conkling, Stephen Girard Building, Philadelphia. Owner, name withheld. General alterations changing residence to apartment house. Brick, 3 stories, 12x50 feet add., slag roof, hot water or steam heat, combination light, oak and pine floors, tile work, steel stairway. Architect taking bids due as soon as possible from Lam Building Co., 1001 Wood street, Philadelphia.

## Lumber and Service

"Job lots and bargains are all right when you are buying collars or shoestrings," said the Old Man to his junior partners, "but if we decide to build this year, I want to know beforehand who is going to furnish the lumber. If this new addition is to be finished by winter, we shall need something beside flooring and shingles—we have got to have SERVICE."

And so the Old Man insisted that all the lumber should come from Lloyd—for he had had experience; he had paid a high price for it.

Can you make use of his experience in your building plans, or do you feel that you must have some fresh experience of your own?

### WILLIAM M. LLOYD COMPANY

Established 1868

29th and Ridge Avenue

PHILADELPHIA

Philadelphia. Architect, Charles Barton Keen, Bailey Building, Philadelphia. Owner, Philomusian Club, 3944 Walnut street, Philadelphia. General interior alterations, miscellaneous work, steam heat, electric light, tile and marble work, oak floors. Plans in progress. Architect will take bids in one week.

**Building (alts.)**, No. 2, Girard College, Philadelphia. Architect, John T. Windrim, Commonwealth Building, Philadelphia. Owner, Girard College Trustees, Stephen Girard Building. Stone, brick and steel, 3 stories, tile and yellow pine floors, hot water heat, electric light, tile and marble work, metal lath. Owners taking bids due June 26th. H. H. Burrell, 206 South Quince street; F. A. Havens Co., 845 North Nineteenth street; H. E. Baton, 1713 Sansom street; F. L. Hoover & Son, 1023 Cherry street, and F. W. Van Loon, Denckla Building, are figuring.

**Residences (22)**, South side of Osage avenue, between Sixty-second and Sixty-third streets. Architects, private plans. Owner, Barnet Rubin & Samuel Cohen, 411 South Sixty-second street, Philadelphia. Brick, 2 stories, slag roof, oak floors, hot water heat, electric light, tile work, stone foundations. Owners taking sub-bids.

**Store and Dwelling (alts.)**, Northeast Corner Thirty-seventh and Walnut streets. Architect, Herman H. Kline, 536 Mifflin street, Philadelphia. Owner, name withheld. Brick, 3 stories, 25x75 feet, slag roof, oak floors, hot water heat, electric light, tile and marble work, flush bulks. Architect will be ready for bids in a week.

**Residence and Garage**, Fifty-second and Overbrook avenue, Wynnefield, Philadelphia. Architect, Addison H. Savery, Stephen Girard Building, Philadelphia. Owner, Frank B. Heyburn, 5902 Carpenter street, Philadelphia.

Stone, 2½ stories, 31x44 feet, wing 16x21 feet, garage, 1½ stories, 23x29 feet, slate roof, hot water heat, electric light, tile and marble work, oak floors, cement work. Architect has received bids.

**Moving Picture Booth**, Twenty-sixth and Jefferson streets; **Removable Floor**, over swimming pool, Twelfth and Reed streets, and **Roof** on swimming pool, Twenty-fourth and Cumberland streets. Architect, private plans. Owner, City of Philadelphia, Board of Recreation, City Hall, Philadelphia. Lowest bidder: E. C. Durell, 1713 North Twenty-fourth street, Philadelphia.

**Building (alts. and add.)**, 223 North Twenty-first street, Philadelphia. Architect, John T. Windrim, Commonwealth Building, Philadelphia. Owner, County Commissioners, 130 City Hall, Philadelphia. General alterations and add., plumbing, heating, ventilators and electric work. Lowest bidder on const. work, Mitchell Bros., 2125 Race street, Philadelphia, \$29,500.

Low bidder, Boyle Robertson Co., Washington, D. C., \$210,290, 100 days.

### THE HOME OWNER'S INTEREST IN CITY AND TOWN PLANNING AND EXPANSION

(Continued from page 369)

3. Recommended street widths will be indicated.
4. Indication of present public utility and mechanical systems, with graphic presentation of recommended extensions.
5. Storm and sanitary sewer and water supply lines, with location of main trunk line extension, and disposal systems in new territory.
6. Recommended park and boulevard system.
7. Recommended zoning system, with graphic determination of industrial, commercial and residential areas.
8. General location of existing and additional recreational facilities.
9. Present railroad and trolley systems, with recommended extensions and changes, freight and passenger.

In the past, the cities of America, like the well-known Topsy, have "just grown." Our factory sections and business sections have developed at logical points, influenced by traffic conditions, the location of railroads and docks. Residential sections have been developed, many of them where industrial workers are housed, being located near the factories, and having in many cases developed into potential or actual slums.

The location of more attractive residential sections has been influenced by natural conditions and by the extension of lines of transportation. The activities of real estate men and speculative builders have usually influenced the planning of outlying sections of every city. Farms have been cut into lots, and these sub-divisions or allotments have been sold off and built up. Later the growth of the city has brought more congested devel-

opment to a point which includes such sections, and the tying up of poorly planned streets, together with the factors of inadequate street widths, have resulted in bad traffic conditions, irregular lots and unstable real estate values.

Probably the greatest appeal that any particular subject may have is the appeal to the individual taxpayer. For this reason it may be well for us to analyze the various factors which may constitute bad planning in a city and to determine how such factors increase the tax rate and may have an adverse effect on general city prosperity. We may learn from this analysis why it pays the individual property owner or taxpayer to have a good city plan developed for his municipality.

As an example, let us consider the cost of extending highways and streets as the city grows. In practically every city in the United States we find a condition where large sub-divisions have been laid out in the suburban sections of the city. As there was no definite plan to indicate the principal streets in such sub-divisions, street layouts have generally been planned by individual developers and the map has been filed with the city. In accordance with this individual layout, streets have been developed and houses have been constructed in a manner undoubtedly pleasing for the small community or the individual development, but having very little relation to the ultimate growth of the city. As the years pass, the city in extending its streets reaches this developed territory and finds great difficulty in tying up a system of proposed streets.

In order to perfect the street system of the city it is in many cases found necessary to condemn property and to remove or demolish buildings which have already been constructed. Such proceedings represent costs which must be borne by the taxpayer.

The plan for city expansion should, therefore, show the logical extension of highways and street systems in still undeveloped territories surrounding the city. Real estate developers and sub-dividers in taking up new pieces of land can then conform to the general city plan and their streets may be laid out to form a harmonious unit of the city as it may develop through and beyond their property in years to come. In this manner the city may grow along attractive and economical lines without having to meet the difficulty of poorly planned sub-divisions of difficult access.

In the question of sewer and water supply, city planning again shows its

value and money-saving possibilities for the individual taxpayer. The installation of sewer and water systems having a capacity which cannot be extended beyond present or near future demand represents a direct waste and large cost to the city. Through the medium of city planning and general street and highway layout in undeveloped territory may be determined. After this is done, a study of the sewer and water problem may be made, not only for the existing city and to relieve present conditions, but plans may be developed for systems which will be adequate for the city even after a growth of many years. In this manner the various installations may have a capacity which will render them serviceable at all times as a unit of a larger development. Sources of supply, points of disposal, grades, pipe sizes, location of main trunk line and general engineering details may be carried out in plan and built in various sections of the city as the demand grows.

In this manner the scrapping of old system rendered useless because of a lack of capacity for the greater demand is avoided.

In these and many other ways by careful planning, years in advance of the city's growth, the expenditure of city funds may be made efficient and certain to bring the greatest result for the money spent. In years past, during the period of haphazard growth of our cities, there is no doubt that in many cases city funds have been unintentionally wasted and the maximum of efficiency, attractiveness and economy has not been enjoyed. The unstudied layout of streets and the rapid growth of developing communities have resulted in creating points where traffic conditions are very bad, and even dangerous. In many cases business streets are too narrow and result in conditions which are disadvantageous to merchants and to the general public. Public parks and recreational facilities are found to be inadequate, and the cost to the city of extending such system in already developed territory is high and must be borne by the taxpayer.

Uncontrolled civic development is found generally to be a menace to real estate values, particularly where there is lacking a zoning system which will confine industrial and commercial activities to certain territories and avoid encroachments in residential districts. It is no uncommon experience to find in our cities large residential districts which have been developed in sections which should logically be given over to manufacturing or business activities. As a city grows,

We have pebbles all sizes. Cost less than what you are using. **DAVID FRANCE CO.**, Tasker Street Wharf, Delaware River, Philadelphia.

manufacturing activities will find their logical location, in many cases to the detriment of residential districts, and causing a depreciation of land values, a loss which must be borne by the individual land-holder. By careful city planning certain zones may be determined in which manufacturing and business activities should intelligently be located. In this manner such activities may be confined to certain districts and residential areas developed which are certain to be free from invasion by unattractive occupancy. Through the operation of proper building and housing codes, protected residential areas should be encouraged and the home builder may be certain that the attractive section of the city in which he locates his home will not ultimately be invaded by ugly factory buildings or other activities which may be detrimental to continued use of his property for residential purpose.

We find, then, that from the viewpoint of the average citizen, city planning which will intelligently direct the expansion of the city means economy in the expenditure of city funds allotted for development purposes. We find also that the city may be made a more attractive place to live in through the medium of careful planning. Park and boulevard systems are not a great expense to a city provided the land can be obtained far enough in advance of the city's expansion to make its purchase possible at low cost. If a city plan is made to show where parks should be located in years to come, it is not expensive or difficult for the city to obtain the necessary land and to hold it for development until such time as its development for this purpose may be needed. We find also that by careful study of existing conditions relief may in many cases be afforded at congested centers of traffic without a great expenditure of public funds. This may often be done by tying up existing streets in a manner which will tend to divert traffic away from the one point of congestion, or through the medium of rerouting traffic to certain sections of the city.

Every citizen is anxious to see his city grow, as upon the growth of the city is predicated individual growth in the form of increased valuation of property holdings and increased business. Civic growth is based on industrial and commercial growth, which may result in the increase of employment and the consequent financial contribution to the economic activities of the city. Factories do not locate in a city merely on invitation, or even because of an offer of co-operation in the way of free sites and inexpensive manufacturing facilities. For

increased industrial growth it is necessary to increase civic facilities; that is, the facilities which will afford better living, working and transportation conditions.

As an example, we may cite the case of a small manufacturing city in the State of New Jersey. Because of a strategical geographical position offering combined railroad and harbor facilities, for the shipment of freight and the bringing in of raw materials, this city enjoyed a phenomenal industrial growth over a period of some years. Large factories were built and an extensive industrial population was brought into the city. The growth of the city was not, however, controlled along logical lines. Residential sections sprung up on land which should be used ultimately for additional factory sites. Public reservations for parks and playgrounds were not made, and the sewage system which was installed was entirely inadequate to handle the increased disposal brought about by civic growth. Business streets were developed in a manner entirely inadequate for city expansion and no study was made of the problem of water supply. This city, therefore, offers no inducements for residential purposes; general business is carried on under hampering limitations, and, in order to make even a few necessary improvements and because of the high cost of city administration, the tax rate has gone up in a manner which is proving a menace to the prosperity of the city. In other words, the civic growth, being unplanned and uncontrolled, has not kept pace with industrial growth, and as a result two important factories are moving from the city and one large organization which had intended locating at this point, bringing with it a payroll of over five thousand men, has decided to locate where general civic conditions are better.—*American Property Owner.*

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

## DUCK SHOOTING and COMMON SENSE

When you buy space you buy it with the expectation of getting a reasonable return on your investment. Sure you do. Now where do you stand the best chance of getting that return—in the daily newspaper, whose circulation is confined largely to people with no interest in your product, or in the trade paper, every copy of which goes to a reader directly interested and likely at any minute to need your goods?

If your hobby is large circulation, you will spend your money in the daily—but before you take this step suppose you pause long enough to figure just what percentage of the immense circulation, for which you will pay a fancy rate, is going to go where there is so much as an off-chance of it doing you any real good. FROM THE ANGLE OF THE MAN WHO HAS BUILDING MATERIAL TO SELL, FULLY NINETY PER CENT. OF THE SWOLLEN CIRCULATION OF THE DAILY NEWSPAPER REPRESENTS WASTED AMMUNITION. It is going to readers who are not interested in building material, and are not likely even in a remote sense ever to build or have building done.

IF YOU WANTED TO SHOOT DUCKS YOU WOULD NOT FIRE PROMISCUOUSLY INTO THE AIR, HOPING THAT BY SHEER LUCK SOME MISGUIDED MALLARD MIGHT ACCIDENTALLY WANDER INTO RANGE, OF COURSE YOU WOULDN'T! YOU'D GO WHERE YOU KNEW DUCKS TO BE, and, sighting a covey of 'em, you'd bang away with both barrels. So it is with advertising.

In the daily you stand an off-chance in a thousand of accidentally hitting the eye of some fellow with an interest in your line. In the trade papers, such as the Guide, you bang into a colony of readers who are interested in building above all other human activities.

The moral is—when you go duck shooting do your shooting where you know the ducks to be!

WHEN YOU WANT TO REACH THE ARCHITECT, THE BUILDER, THE BUILDING OWNER, THE INVESTOR, THE SUB-BIDDER, IN EVERY BRANCH OF THE CONSTRUCTION FIELD, THERE IS BUT ONE PRESERVE IN WHICH TO GUN:

### THE BUILDERS' GUIDE

Pennsylvania's Oldest and Only Architectural and Building Publication

Perry Building, Philadelphia.

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

CONTRACTORS' SHACKS, TOOL SHEDS, ETC.

**RICHARDSON Products**

Public Showroom:  
1332 Arch St., Philadelphia

The illustration shows the installation of the famous "Star" Ventilator on the War Trade Board Building, Washington, D. C.

### "STAR" VENTILATOR (Patented)

The "Star" Ventilator was adopted by the U. S. Government as its War Standard for cantonments and other important buildings, on account of its **HIGH EFFICIENCY** and **SIMPLICITY**.

The Thousands of "Star" Ventilators in use on public buildings, schoolhouses, mills, warehouses, and similar structures throughout the country, proves their superiority over other types.

We also manufacture Evans "ALMETL" Fire Doors and Shutters, Metal Tiles and Shingles, approved by the U. S. Gov., and High Grade Roofing Tin.

### An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

### ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates. Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

## As The Editor Sees It

THE war brought to America many serious and difficult problems. Projects were undertaken and carried to a successful termination which, in view of the country's unpreparedness, were at first deemed impossible. In the solution of these problems, America has learned many valuable lessons which will change the course of the present and future events. Old methods and condition have gone, never to return, and it is for everyone now to grasp the full meaning of these new conditions before us.

The problems attendant upon the war were in no way more difficult nor of greater importance than the problems of the reconstruction period. One of the most serious of these latter is the housing situation. Every city in the country is underbuilt; every city is suffering for lack of adequate housing facilities. Many places not fit for habitation are in use at the present time and the need must be met at once. The cry that construction is high does not appear to be justified, but is rather the unthinking judgment of the uninformed or the misinformed. According to Michael A. Mikkelsen, U. S. Department of Labor, the fact is that the cost of construction is not high today. It is low compared with food, clothing, and commodities in general; for example, in January of this year a given quantity of farm products would exchange for 37 per cent. more of common building materials than the same quantity could be exchanged for in

1913. It is high only in comparison with its own pre-war level. Commodity prices will undoubtedly recede, because food and clothing and many other things were affected by special war conditions; for example, scarcity of transportation, which prevented shipments from distant countries to the Allies. But they cannot fall to the pre-war level.

But although some readjustments in the wages of individual trades and in the prices of individual classes of building materials may take place, the cost of construction will not come down to such an extent as to endanger a judicious investment made today in the erection of a new building. Where the rents offered show a fair net return on the cost today of a new building after deducting a reasonable sinking-fund allowance, no one should hesitate to build or to lend money for building.

Rents are determined by supply and demand. In the case of housing, during the early part of the war, the demand was curtailed by the rapid advance in commodity prices, which impelled many tenants to crowd into or get along with less space than their normal standard of living required, and by the drafting of the young men of military age. Within a year, however, these influences had spent their force. By the end of 1918, according to the replies obtained from a questionnaire sent to real estate boards in 91 cities, only four of these cities had a housing demand that was below normal, while in 52 cities rents

had advanced 10 per cent. or more; in some instances 40 per cent. to 50 per cent. This rise in rents took place at a time when the population at home was as economical of house room as possible and while several millions of soldiers were absent in the service.

Another important fact was disclosed by the replies to the questionnaire, namely, that despite rising rents for housing in the majority of the 91 cities, the market value of house sites had declined in six cities, and had remained practically stationary in 72. The market value of land is, like rents, determined by the interplay of supply and demand. During the war the demand for city land was relatively small, because dealing in real estate was discouraged by the bank as a non-war activity requiring the use of credit. With a restoration of easier mortgage loan conditions, the demand for real estate will inevitably increase; nothing can seem more certain than that in our growing American cities the market value of land must advance briskly.

A judicious investment in the erection of a new building does not depend solely on the cost of construction. It may well happen that the man who buys a plot today and builds on it a house the cost of which is not greatly out of proportion to the cost of the land will be better off a year from now than he would be if he had left his money in the savings bank in the meantime. City land

at present is the least inflated of all material wealth.

Furthermore, F. T. Miller, Director, Division of Public Works and Construction Development, Information and Education Service, Department of Labor, says:

"On the basis of its study, the department has come to the conclusion that construction in 1919 can be justified on financial grounds. It rejoices to find such a widespread acceptance of its views as is evidenced by the remarkable resumption of construction activity within the last three months."

\* \* \*

THE valuable lessons in efficiency taught by the war can well be applied at the present time to construction. Building must be resumed and everything must be done to best fit the construction industries to handle the huge task before them.

In the opinion of Mr. M. C. Tuttle, General Manager of the Aberthaw Construction Company of Boston, a reduced wage scale is not an indispensable preliminary to resumption of activity in the building trades.

"In the course of viewing numerous undertakings more or less closely associated with interests of the Government," says Mr. Tuttle, "I have lately been impressed to find the statement commonly made that costs of operation are beginning to show a noticeable decline. And this, almost without exception, was attributed to increased efficiency of the labor force, due in part to the opportunity for weeding out the less dependable workers, and in part to the growing desire of all members of the force to retain their jobs.

"Owing to inadequate or otherwise unsatisfactory cost systems maintained in connection with most of these undertakings, I found it impossible fully to check the statement by actual figures. Accordingly, I asked my own company to make out the cost of any one process in an operation continued over a period of several weeks. That which was selected was a piece of concrete work; the costs studied were those for the common labor employed on this work from January 7th to February 4th of the present year, inclusive. During this period the wage scale remained unaltered; but the personnel of the labor force underwent frequent changes.

"A graph of the labor cost of the work during the period noted shows a sharp and almost undeviating decline from day to day. On February 4th these costs were exactly 50 per cent. less per unit than were those of January 7th. It is my belief that the experience of my company is by no means isolated; and that in almost any labor force there lies the

opportunity of realizing economies ranging from 20 to 50 per cent. without interfering with the wage scale.

"This implies, of course, that there is now increased opportunity for selecting men according to their suitability for a given task, and an increased eagerness on the part of the men to make good. But this is as it should be; and the whole country ought soon to feel the effect of it in general improvement at all points. It is a case of supplanting so-called *liquidation of labor* by proper *adaptation of labor* as a means of keeping the cost of doing things within the bounds of utility.

"And in this connection it may well

be urged that state of mind is often as potent a factor in ultimate labor costs as is the rate per hour. Any one experienced in handling workmen has recognized the difference in output between a cheerful, capable man, anxious to hold his place, and one who is a little disgruntled, and quite conscious that he can get another job the moment he drops the present one. Multiply either case by thousands of individual instances and I believe there will be found, in shifts of mental attitude, the explanation of much of the variation which occurs in unit cost. And this, after all, is the element of labor which directly affects the profits of the employer."

## HOUSING—ITS RELATION TO SOCIAL WORK

BY ALBION FELLOWS BACON.

There never was a time when social work was more important. There never was a time when Housing was more important, and its relation to social work so clearly recognized. The recent war enlarged the field of social work immeasurably. It also suddenly brought to light the relation of housing to all classes of people, to industry, to government employees, to the very winning of the war.

President Wilson has said that the war was to make the world a fit and safe place to live in. The social worker's job also is to make the world a fit and safe place to live in. That is the job of the Housing worker, too, and this country will never be a fit and safe place to live in until "All the Homes of All the People" are safe—until every little child is safe in its own home.

The purpose of this paper is to establish the true and correct relation of Housing to social work. There seems to be no relation, in most communities, or, that relation is not understood, because Housing is not understood. So let us begin with definitions.

Housing means shelter, dwelling places, homes. You speak of "housing" workmen, just as you speak of "housing" machinery, only the first is not done as carefully as the latter. The term properly refers to every place of habitation, whether it be a dwelling house, hotel or sanitarium. The housing problem is the problem of providing fit and adequate dwelling places for every person in a community.

People can be housed—they are housed—in shacks, in stables, in lodging houses, in tenement barracks, in derailed cars, in old hotels, in garrets, in cellars, in sties, in compartment houses. None of these places are fit for homes. They

are called "homes," but they are not. So we lump them in "housing." But they come under bad housing.

The home or the house that is safe, sanitary, convenient, comfortable, a fit place to rear a family, comes under good housing. That belongs to the upper story of social work. The foundation and the first story of social work must begin with those conditions of the unfit, unsafe home—bad housing, slums—that devastate and ruin human lives. These are the conditions that pile up social wreckage faster than churches can evangelize, faster than schools can educate, faster than doctors can cure, faster than stretcher bearers—I mean social workers—can bear them off the field.

I speak from ten years' experience as a social worker, and ten years' experience, after that, as a housing reformer, for I came into housing reform through the doors of social work. I had labored for child welfare, for working girls, for social uplift and civic betterment, for public health, worked against vice, against tuberculosis, tried to relieve the sufferings of the poor and the aged. I found that all I could do gave only temporary relief, only partial improvement. That until we could get people who needed cures, families that needed to be reinstated into a more sanitary house, and a more favorable environment, we might give them a lift but we could not keep them up.

Let me say here that we must recognize that all social workers meet cases that seem hopelessly wrecked (especially among the older ones) or that are so mentally defective that they have nothing to build on. But there is no case so bad that bad surroundings will not make it worse. And though an improved en-

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

**Garage**, Sixty-fifth and Upland streets, Philadelphia. Architects, Clark & Dudnick, Drexel Building, Philadelphia. Owner, name withheld. Brick, 1 story, 54x140 feet, slag roof, cement floors, timber trusses, steam heat, electric light, stone foundations, rolled steel sash, hollow metal skylights, steel rolling doors. Plans completed. Architects taking sub-bids due as soon as possible.

**Garage**, 6127 Oxford street, Philadelphia. Architect, H. Childs Hodgins, 130 South Fifteenth street, Philadelphia. Owner, C. A. Freihofer, Twentieth and Indiana avenue. Brick, 1 story, 21x22 feet (2 cars), asbestos shingle (J-M) roof, cement floors, stone foundations, electric lighting. Architect will be ready for bids in a few days.

**Factory (add.)**, Twentieth and Indiana avenue, Philadelphia. Architect, H. Childs Hodgins, 130 South Fifteenth street, Philadelphia. Owner, Freihofer Baking Co., on premises. Steel and reinforced macite, 20 feet high, 20x136 feet, reinforced macite roof, electric lighting, steel columns, rolled steel skylights. Architect will be ready for bids in a week.

**Residence (alts.)**, Broad and Courtland streets, Philadelphia. Owner, Dr. S. Goldberg, 4415 Germantown avenue, Philadelphia. Architect, Horace W. Castor, Stephen Girard Building, Philadelphia. Rearrangement of offices, mill work, plastering, painting, glazing, oak floors. Architect taking bids due July 3d. Wm. H. Graham, 3649 Filbert street, is figuring.

**Residence**, Germantown, Philadelphia. Architect, C. A. Ziegler, Stephen Girard Building, Philadelphia. Owner, Charles Calwell, Second and Chestnut streets, Philadelphia. Stone, 2½ stories. Plans in progress. Too early for details.

**Residence and Garage**, Northeast corner Sixty-first and Hazelhurst streets, \$6,800. Architect, private plans. Owner, Thomas J. McGarvey, 2146 South Fifty-eighth street, Philadelphia. Brick, 2 stories, 20x32 feet, slag and asphalt roof, hot water heat, electric lighting. Owner will build.

**Dwelling (add.)**, 5918 Market street, Philadelphia, \$5,000. Owner, Leon Braker, 5820 Spruce street, Philadelphia. Brick, 3 stories, front add. 16x7 feet and 16x8 feet, slag roof. Owner will build.

**Dwellings**, Roosevelt Boulevard, South of Summerdale avenue, \$48,000. Architect, private plans. Owner, Harry R. Moyer, 2035 East Allegheny avenue. Brick, 2 stories, 16½x48½ feet, slag and slate roof, hot water heat, electric lighting, oak floors. Owner will build.

**Elevated Stations (4)**, York street, Dauphin street and Girard avenue. Architect, private plans. Contracts Nos. 553, 554, 555, 563. Owner, City of Philadelphia, Department of City Transit, Mershon Building. Owners taking bids due July 8th. Monaghan & Losse, Inc., 3016 Chestnut street; E. F. Bahls

Co., 1702 North Thirteenth street, and Pringle Borthwick, 8018 Germantown avenue, are figuring.

**Residence (alts. and add.)**, 3605 Powelton avenue. Architect, Le Roy B. Rothschild, 1225 Sansom street. Owner, M. I. Crane, 3605 Powelton avenue. Brick, 3 stories, 12x14 feet, slag roof, maple floors, stone foundations, hot water heat, electric light, tile and marble work, dampproofing and waterproofing. Architect taking bids due July 3d. Davis & Clayton, 1817 North Twentieth street, are figuring.

**Residence**, St. Martins, Philadelphia. Architect, Herman L. Duhring, Bailey Building, Philadelphia. Owner's name withheld. Stone, 2½ stories, 40x60 feet, shingle roof, hot air heat, electric light, tile work. Architect will take bids in about three weeks.

**Residence (alts. and add.)**, 1510 Oxford street, Philadelphia. Architect, P. M. Sax, Franklin Bank Building, Philadelphia. Owner, Arthur Loeb, Franklin Bank Building, Philadelphia. Brick and steel, 3 stories, 10x31 feet, tin roof, parquet floors, stone foundations, steam heat, electric lighting, metal lath, iron work. Architect has received bids.

**Residences and Garages (2)**, Northeast Boulevard, near Second street. Architect, E. Allen Wilson, 1218 Chestnut street, Philadelphia. Owner, name withheld. Stone, 3 stories, 30x40 feet, and 1 story, 12x18 feet, slate roof, oak floors, hot water heat, electric lighting, tile and marble work. Plans in progress.

**School Buildings**, Forty-second and Spruce streets, Philadelphia. Architects, Zantlinger, Borie & Medary, Otis Building, Philadelphia. Owner, Protestant Episcopal Divinity School, care of Rev. George Bartlett, 316 South Tenth street, Philadelphia. Stone. Plans in progress. Too early for details.

**Bank Building**, 1429 Chestnut street, Philadelphia. Architects, Stuckert & Co., Crozer Building, Philadelphia. Owners, Republic Trust Co., 1429 Chestnut street, Philadelphia. Steel, brick, granite and terra cotta, 4 stories and basement, 20x95 feet, stone foundations, steam heat, electric light, tile, marble and terrazzo work, bronze work, ornamental iron work, dumb waiter, electric fixtures, rolled steel sash, vault, bank fixtures, (1) elevator. Architects ready for sub-bids due July 7th.

**Sunday School Building**, Fifty-fourth and Spruce streets, Philadelphia. Architect, George E. Savage, Witherspoon Building. Owner, Bethany Temple, Fifty-fourth and Spruce streets, Philadelphia. Stone and brick, 2 stories, 108x83 feet, wing 24x27 feet, slag roof, maple and pine floors, stone foundations, steam heat, electric light, rolled steel sash, iron work. Architect taking bids due July 7th. A. R. Raff Cont. Co., 1635 Thompson street; James Johnston, 1721 Ludlow street; E. E. Hollenback, Inc., 1804 Brandywine

street; F. E. Wallace, 1220 Chancellor street; George F. Pawling Co., 1432 South Penn Square, and George B. Bond, Twelfth street and Sixty-sixth avenue, Oak Lane, are figuring.

**Warehouse and Offices (alts. and add.)**, 1821 Market street, Philadelphia. Architect, Frederick Webber, Morris Building, Philadelphia. Owners, E. W. Koons & Co., 911 Filbert street, Philadelphia. Plans in progress. Too early for details.

**Store and Apartments (alt. and add.)**, 1010 Girard avenue. Architects, Hoffman-Henon Co., Finance Building, Philadelphia. Owner, Samuel Cooper, 1010 Girard avenue, Philadelphia. Brick, stone and steel, 3 stories, 18x19 feet, slag roof, pine floors, stone foundations, steam heat, electric light, tile, marble and terrazzo work, rolled steel skylights. Architects have received bids.

**Dwellings (28)**, West side Fifth street, Grange to Nedro, \$126,000. Architect, private plans. Owner, Walter S. Bauer, Fifth and Chew streets, Philadelphia. Brick, 2 stories, 18x32½ feet, hot water heat, slag roof. Owner will build.

**Dwellings (23)**, 5001-47 North Camac street, Philadelphia, \$115,000. Architect, private plans. Owner, George Schwim, 1524 West York street, Philadelphia. Brick, 2 stories, 15 feet 8 inches x32 feet 2 inches, 12x17 feet 10 inches, slag roof, hot water heat, electric light. Owner will build.

**Building (alts.)**, 1211 Chestnut street, Philadelphia, Cont. No. 113. Architect, private plans. Owner, City of Philadelphia, Department of City Transit, Mershon Building. Wood and glass partitions in offices of eleventh and twelfth floors. Owners taking bids due July 8th at noon.

**Building (alt.)**, 3533 Germantown avenue. Architect, H. W. Wooters, 816 West Allegheny avenue. Owner, Henry Reinhardt, on premises. Brick, second story add. 22x65 feet, slag roof, wood floors, electric light, hollow metal skylights (heat reserved). Architect taking bids due July 11th. H. P. Werner & Co., 3245 Germantown avenue; Jacob Y. Loux, 3731 Old York road; Henry P. Schneider, 3713 Old York road, and John Schuster, 3552 North Fifteenth street, figuring.

**Store (alt. and add.)**, 2107 Germantown avenue. Architect, William H. Wooters, 816 West Allegheny avenue. Owner, Leon Kappelman, on premises. Brick and steel, 2 stories, 10x85 feet, slag roof, cement floors (electric light and heat reserved). Plans in progress.

**Theatre**, Manheim and Germantown avenues, Germantown. Architect, private plans. Owner, Steifel & Fox, Manheim Theatre, on premises. ## Lumber and Service

In a building operation everything must be on the spot at the right time. The first thing you need is SERVICE. The finest flooring in the world is of no use if when the men come to lay it you find it is stuck in a freight jam at Norfolk, Virginia.

The right kind of service avoids freight jams. When Uncle Sam was building, he called on us to help keep his lumber cars moving. So we have had a post-graduate course.

Fifty years' experience is at your service when you build, if you see that the lumber comes from LLOYD.

**WILLIAM M. LLOYD COMPANY**

Barrett Specification Roofs on  
plant of Beech-Nut Packing  
Co. at Canajoharie, N.Y.

## A QUALITY PLANT WITH A QUALITY ROOF

**T**he Beech-Nut Packing Company started  
out years ago with the Quality idea in food  
products.

Covering its first Quality food factory was a  
Quality roof—a Barrett Specification roof.

And as the years have passed and the wonderful  
growth of the Beech-Nut business has demon-  
strated the soundness of the Quality idea in  
foods, additions and new buildings have been  
added to the plant—and they have all been  
covered with the same Quality roof.

Today the entire plant, illustrated above, is  
covered with Barrett Specification Roofs.

### *The Quality Idea in Roofs*

Many years ago The Barrett Company started to  
work out a specification that would make it possible  
for building owners everywhere to obtain through  
their local contractors, a Quality roof based on the  
best scientific principles of roof construction.

The result was The Barrett Specification. Today  
Barrett Specification Roofs cover more permanent  
buildings than any other type.

They take the base rate of insurance; they are  
guaranteed (under the simple conditions stated below)  
for a period of 20 years, and, what is perhaps most  
important of all, *they cost less per year of service than any  
other type.*

### *20-Year Guaranty*

We offer a 20-Year Surety Bond *guaranteeing* Barrett  
Specification Roofs of fifty squares or over in all towns  
of 25,000 population and more, and in smaller places  
where our Inspection Service is available.

This Surety Bond will be issued by the United  
States Fidelity & Guaranty Company of Baltimore and  
will be furnished by us without charge. Our only re-  
quirements are that the roofing contractor shall be  
approved by us and that The Barrett Specification  
dated May 1, 1916, be strictly followed.

*A copy of The Barrett Specification with full information  
free on request. Address nearest office.*

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

## HOUSING—ITS RELATION TO SOCIAL WORK.

(Continued from Page 384.)

vironment may seem to offer no hope of betterment, it will at least lessen their misery when they are taken out of damp, dark rooms. It will lessen their chance of disease, and the chance of giving contagions to others. It will lessen congestion, and reduce the moral menace to other families.

Now, as I said, it is bad housing—slums—that I must treat of mostly. It is to the slums, or near-slums, that you generally go to find your patients. It is there the police are oftenest called, where the patrol and ambulance make most trips; where the quarantines are oftenest necessary. If it were not for slums, a lot of social workers would lose their jobs; the police force, the fire department and the health department could all be cut down. Fire insurance would be cheaper, in many districts, and so would life insurance. You know, doubtless, that life insurance companies will not give premiums in the worst slum districts.

I might go a little further and say that if it were not for houses we would not have some of our diseases. Before houses, there was no tuberculosis, probably no pneumonia. Both are house diseases. You find them worst where you find most dark rooms and congestion.

I mean the worst old houses in your community, whether you have 2,000,000 or 200—the houses where you keep your poor. Shut your eyes and think of the places where your poor live. I have visited the slums of many states, in cities, villages, or country places. I can see now the place that is before your mental vision. It is a rickety old house.

The house you are thinking of is one of the oldest houses in the town. Ten to one it was the home of an early settler, perhaps once a mansion. Now it is tumbledown, rotting, weather beaten, gray. It stands flat on the ground. Other houses have crowded up against it, perhaps business houses, so that it is dark and gloomy. It has several families in it, from two to a dozen, or more. They are weather beaten and gray, too. They look like members of the same family, in a way, slipshod, sallow, sullen, unsmiling. Dirty babies are crawling down dirty stairs, dirty children playing in the dirty yard. There is a gray washing in the yard. There are blackened, rotting sheds in the yard, perhaps an old uncovered cistern. The yard is damp, with dishwater and suds. It has

no grass, maybe tall weeds. Garbage is piled on the ash heap, and flies are everywhere.

If the house is in a village, it may have only one or two families. If it is in a city, you are thinking of an old hotel, or a row of tenements, perhaps a Ghetto, where shops below have a display of fish, or old clothes, or junk, or shabby groceries; where old crones with shawls over their heads, draggled skirts, and slippers down at heel sit at the door, with one eye on the customers, the other on a baby in the gutter or the boys fighting in the street.

You have a mental vision of the dark, narrow, dirty stairs, mounting up to dark, narrow, dirty rooms; of filth and odors everywhere—of congested, swarming life.

No matter whether you live in city or country, you see, in your mind's picture, the bent, hollow-chested consumptive; you hear the rattling cough; you see the sick baby, the pale, weary mother.

Tuberculosis is the one unfailing specter that everyone of you encounters, whether you work in back woods slums or big city slums. We find country houses with a record for wiping out two, four, even six families by tuberculosis, in succession, as they move in. These are houses that are *infected*, that could not be disinfected by fumes, by soap, lye or paint, because the crevices are so wide, because the walls are so rough, and the plastering so broken.

It is not possible to escape getting tuberculosis if one moves into such a house, once the disease gets a hold on it. Everything about the house favors the disease, when it is low, damp, musty, dark and gloomy. If the patient is sent away in time, and cured, he takes it again when he comes back. It is a case of *house*.

Every social worker knows what tuberculosis means, in multiplying cost and effort, in leaving dependent orphans and widows, in bankrupting the family by the long illness. I need not dwell on that.

In the city tuberculosis is increased by congestion. Houses built in crowded rows have dark, inside sleeping rooms, dark halls, gloomy yards, if any. I need not do more than mention what the dark room means to tuberculosis. In the city humanity is more condensed. I need not tell you what congestion means to tuberculosis.

I may have to explain, however, that congestion must be counted as a housing evil, because it means inadequate housing facilities, and over-built lots.

So much for tuberculosis. If I stopped here I would feel that the relation of housing to social work had been established.

But there are other house diseases—pneumonia, which congestion, with the consequent foul, vitiated air, makes so much more fatal. "Colds," with their long train of evils, resulting from dampness, sudden chill from draughts, lowered vitality, bad air; inflammation of the respiratory organs, tonsillitis, rheumatism, heart trouble—the long linked chain is found in all of these dark, damp, unventilated, overcrowded houses.

Added to these are the "filth diseases," spread by contact, like eruptive diseases, or typhoid, disseminated in sewage polluted water or filthy milk. These are all increased by congestion.

How much do they all add to the burden of the social worker?

I have the word of more than one visiting nurse that her efforts were useless in many cases, so long as the family lived in the unsanitary houses where they were always sick, and could not get well. "When I go down to Reese's Row they beckon to me from all the doors," one nurse said. All social workers know of cases that have improved in health when moved to sanitary quarters, until the bread winner had been able to go back to work, and the family was no longer dependent.

I have said that before houses certain diseases did not exist. Have you ever thought that even our crimes have changed?

Before we had large cities, crimes were mostly due to too high spirits and the over abundant vitality of outdoor people. Read the old sages—read the stories of early Saxon or Briton fights and robberies.

I appeal to those who have charge of our reformatories to know if crimes now are not mostly due to diseased bodies or brains, or to defective mentality; to minds over-clouded by brooding among shadows; or due to lowered resistance, to low vitality, and the stimulants craved as an offset to low vitality; to the over-close contact forced by congested living, and the nervous irritability due to the foregoing conditions.

(Continued Next Week.)

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

## As The Editor Sees It

CERTAIN important factors having direct bearing upon business conditions today, have been the subject of much interesting discussion and speculation during the past six months. For instance, the question of prices and price tendencies has been talked of on every hand. To build or not to build has been one of the issues of the hour. Now, however, there is every indication that these questions have been satisfactorily answered and business confidence seems an established fact.

The building situation has been very deeply concerned in the uncertainty felt as to prices of materials and labor, and the great and steady increase in building activity evidenced since the beginning of the year is manifestation of an ever-strengthening business confidence.

"American business," says the *American Contractor*, "has learned that its condition is sound. A period of greatly reduced activity has been accompanied by remarkably few business failures. Business has also given over the expectation of falling prices, which, for a time, acted as the strongest deterrent against resumption of activity. Increased prices and increased wages did not retard business during the war. The fact that they need not retard business now is pretty thoroughly understood today. The commercial recovery during the past two months has been remarkably rapid and far-reaching. In this recovery perhaps the most significant indication that confidence has returned is the widespread

resumption of building operations.

In order that building activity may assume proportions sufficient to meet the country's needs for new homes and buildings of every description, it is necessary that large funds must be secured for mortgage investment.

The special committee on housing appointed recently by the Merchants Association of New York has just submitted a preliminary report which states that the problem of producing construction, both for homes and for business use, is a problem of securing funds for building. These funds will have to be provided in large volume, and while many temporary expedients have been suggested, it is absolutely necessary to secure at once a continuing flow of capital into the building business if immediate and permanent relief is to be afforded. To be sufficient and permanent, this must be free capital widely distributed which will seek this employment because of the assurance of the reasonable return which will come to it. It is deterred from this employment now by excessive taxation and by the denial of a proper return after the investment is made.

The report continues that there is a great dearth of funds available for mortgage investment. Practically all building is conducted on borrowed money and there is a drift of capital away from the mortgage market now instead of towards it, and it is largely because of the heavy taxes on the income. This drift can be

reversed and turned in large volume toward the mortgage market if the average investor is assured that he can have a fixed portion of his capital invested in mortgages and be relieved of income tax and surtaxes on the interest upon his investment.

In view of the foregoing conclusions, the committee recommended for immediate action the adoption by the Merchants' Association of the following resolution:

"Resolved, That the first step toward the securing of sufficient amounts of capital for construction purposes is the attracting of capital into the mortgage market by means of which the building business is largely supported, and therefore that the congress be urged to pass a law exempting from federal income taxes, including surtaxes and excess profits taxes, the interest on mortgages on real estate in the United States to the extent of \$40,000 owned by any taxpayer."

\* \* \*

Building all over the country is behind about three billion dollars. We curtailed our buying about eight billion dollars a year to spend the money to get the Kaiser. After having shelved the Kaiser, the country has to work to fill the empty shelves of the stores.

The Old World will have to buy about seven billions' worth of our materials a year, at least for two years. South America needs two billions a year. Yet there are people among us who worry about the future.

## HOUSING—ITS RELATION TO SOCIAL WORK

BY ALBION FELLOWS BACON.

In this connection I may say that in our conferences on mental hygiene we have discussed the relation of housing to insanity and feeble-mindedness. It was agreed by various experts that congestion and dark rooms made every menace of the feeble minded, and every danger to the feeble minded greater. It was also agreed that many a mental breakdown was hastened by the breakdown in health due to unsanitary living condition; and that depression, lowered vitality and irritability, due to house gloom, to noise, to lack of privacy and the general wretchedness of slum living, accelerated many a mental wreck.

Put a strong, normal person into a slum, and he will have a fight to keep his physical and mental poise.

Put a sickly, subnormal person into the slums, and he is overwhelmed.

As social workers find so much of their work among the mentally subnormal, I feel this is in place.

Of course, heredity gives us the mental defective. Environment makes the very worst out of him, and of his children.

Vice also meets the social worker. All I have to say about the relation of bad housing to vice is that the dark room is the mother of shame; that dark rooms and halls offer temptation to both vice and crime. That congestion also makes vice almost inevitable, and that vice is found in connection with congestion and the dark room. The common use of every convenience by both sexes, young and old, promotes vice. Promiscuous living promotes vice. I need not cite examples. You know them. You know that the child of the slums lives in a school of vice.

As a corroboration of the effect of environment, I have had old houses pointed out to me by officers, in different cities. They would say. "Before we cleaned these places up, we had arrests every few days. Now we have no trouble. The people seem to have more self-respect."

This seems to be the keynote of the effect of the slums on family life. The social worker knows the necessity of maintaining or awakening self-respect in the family that he is endeavoring to re-instate. In the slums there is everything to degrade, everything to suggest and foster evil. The housekeeper feels that there is "no use" to try to keep her rooms clean, when no one is responsible for the hall, stairs or yard, when dirt is tracked in on her freshly scrubbed floor, and when soot pours in through the loose window frames. The more thrifty who move into an old tenement

soon succumb to the shiftless, easy-going habits of the older tenants. What, indeed, is the use, when the job is hopeless, to try to make a slum look home-like? I need not go into the details of sights, odors, inconveniences, that every one of you recall. When you went to wait on a sick mother, you had to go downstairs for water to wash the baby, go across the hall to get something to wash it in, and go upstairs to heat the water. You had to close the window to keep out smells and flies, you had to put a chair against the door to keep out the fighting boys. When you found her husband had deserted her, you wondered how he had slept in that stuffy room so long, when a hobo life beckoned him to sweet air and the greenwood tree for shelter. When the pretty daughter went wrong, you remembered that she would never bring her "gentlemen friends" up those greasy stairs, to the room where the wash tub and the coal pile jostled the beds, and the family circle had to stand up, and lock arms.

When the little boy got into the juvenile court, you didn't wonder why he stayed out as long as he could keep awake, before he crept into the stifling room, and fell onto his pallet.

And the children, the little ones!! You hear such words on their baby lips, you see such a knowing look in their baby eyes, that you long to gather them up in your arms and fly with them to a daisy pasture, where they can run and play in wind and sun, and grow up strong—and innocent! It is Child Welfare that has been the strong passion that has kept me at housing reform, because, in every city I visit, I see the little old people of the tenements, weazened, pallid, sickly, stunted in soul and body, growing up to a hopeless life, following in the steps of their parents, unless a miracle lifts them out and away from it.

This is what I want to impress on the social workers, everywhere. Whatever home means to us, it means to others, for human nature is the same, and physical nature is the same, and mental laws are unvarying. If it is necessary for us to have peace, quiet, rest, sunshine and air, a cheerful environment, elevating surroundings, it is necessary for all other human beings. If we were wet, cold, hungry, wretched, shut into a dark room, amid noise and confusion, we would have a struggle to keep well, cheerful, good, and to keep up the home life and atmosphere for the rest of the family.

The fact that thousands of children

are growing up in sties that cannot possibly be made homelike or cheerful, that can never have hallowed associations is, it seems to me, a grave menace that social workers should consider.

Let us remember, then, that a dark room is not fit for a home.

A cellar is not fit for a home.

A stable is not fit for a home.

A house crowded with vicious people is not fit for a home.

A fire-trap is not fit for a home.

A death-trap is not fit for a home.

A house in a vile neighborhood is not fit for a home.

A public place, with no safety from intrusion, is not fit for a home.

Remember this when you visit the poor, and to try to save their little children to something better than the parents know.

Remember this when your Chamber of Commerce reaches out windmill arms to rake in new industries, exulting when it lands a factory with hundreds of working men, but makes no provision for finding them homes—when your city is already congested. Remember this when you see these workmen's families forced to double up in the slums, with the poorest and most degraded people. Remember that the *normal family, forced to live in a subnormal environment, sinks to the subnormal*, if it remains long enough—first, physically, through illness or death of the bread winner, or loss of wages by illness. Then, morally, by lowered standards and loss of self-respect.

See how many recruits are brought to the ranks of poverty yearly, in this way. See if you cannot use your influence against putting workmen's families in slums.

Some of you have long realized the truth of my statements. You have resorted to many devices to improve surroundings, but, unless you have a housing law the best you can do, if a house is in very bad condition, is to get the family to move. Then another family goes in, and you have another case. Landlords won't improve slums unless they have to, and they pay from 15 to 50, even 100 per cent., as we have discovered. Nothing but a law will improve the old houses, or get rid of them. Nothing but a fight will get the law. That's why we have not more laws. "It's a long, long trail a-winding" to get a housing law. But it is worth the fight. We have torn down over 500 old houses in my town, and I want to tear down at least 500 more. We have many thousands to tear down in my State before the wreckage of a century is cleared away. And we are making over hundreds that will stand repairs. Other states are doing it, too. What is your State doing? If it hasn't begun on hous-

ing work, begin at once, for, notwithstanding the opposition of slum owners, and the people who believe that the poor are "naturally vicious and like to be dirty," and the people who want to do things the easiest way, you will find that housing reform is fundamental to social work.

Remember, houses are building today that will be killing and costing 50 years hence.

Remember, too, bad housing is like a

two-edged sword. It cuts both ways.

It injures the poor.

It injures the community.

It cuts hardest of all the real estate man whose property adjoins slums.

It tears down the civic structure you are trying to build.

It ruins civic beauty.

It undermines public health and public morals.

It is the stronghold of vice and evil.

Wipe it out.

## BOND PREMIUMS ON GOVERNMENT CONTRACTS

Plan of Action Outlined for Contractors Affected by Recent Ruling of Comptroller of the Treasury—Decision Not Conclusive, But Requires Test Case and Possibly Appeal to Court of Claims—United Action Through the Associated General Contractors of America Needed.

THE form of "cost-plus" contract used by the Construction Division of the War Department during the war provided in Article II under the heading of "Cost of Work" for reimbursement of the contractor's actual net expenditures. Among the various items was the following:

"(h) Such bonds, fire, public liability, employer's liability, workmen's compensation and other insurance as the contracting officer may approve or require."

Article IX provided that

"The contractor shall, prior to commencing said work, furnish a bond with sureties satisfactory to the contracting officer."

Notwithstanding these provisions, the Comptroller of the Treasury has recently held that the form of cost-plus contract in use by the Construction Division does not authorize the reimbursement to contractors of the cost of premiums on their bonds. This ruling has been adhered to in the face of strong objections by the Chiefs of the Construction Division.

### RULING WILL BE UNIVERSAL AND RETROACTIVE

Upon inquiry of representatives of the Construction Division, it is ascertained that it is quite certain that all contractors having unsettled contracts for work under that Division and money due them under such contracts will now have deducted from any balance due them the sum of all payments heretofore made to them covering reimbursement of premium on bonds. This will probably include not only their unsettled contracts, but such payments made upon other contracts of this class upon which settlements have already been made. It is not possible to say whether those who have

no current construction contracts will be called upon to refund all such sums heretofore reimbursed to them. This will depend upon the discretion of the disbursing officers of the War Department and the orders of the accounting officers of the Treasury.

### PLAN OF ACTION FOR CONTRACTORS TO FOLLOW

The matter is one of very wide importance to members of the Associated General Contractors of America and the officers have accordingly taken up the subject for conference with Messrs. King & King, attorneys at law, of Washington, who give their attention chiefly to matters involving the law of Government contracts and are well known to most of our members. As the result of very careful consideration the following suggestions are made.

### FILE RESERVATION, IF PREMIUM IS DEDUCTED

1. If the amount of premium bonds already is deducted from moneys otherwise due upon current contracts, the contractors should accompany the voucher covering any such payment and showing such deduction with a letter containing substantially the following language:

"It is to be understood that in accepting payment evidenced by the attached voucher under our contract of . . . . ., for constructing . . . . ., we do so without in any wise waiving our legal rights to full reimbursement under the terms of our contract of all sums paid by us as premium on bonds. We expressly reserve our rights to reimbursement of all sums paid by us on such account.

This letter should be pasted to the voucher.

### REFUSE TO MAKE REFUNDS

2. Those who are called upon to refund any payments of the kind noted should decline to do so absolutely and leave the Government to take such action as it may deem advisable looking to a recovery.

### NEW RULING HELD UNLAWFUL

The attorneys named have given us their opinion that the contracts entitle the contractors to reimbursement of these premiums, that the deduction is unlawful, and that it can be recovered by future proceedings in the Treasury Department or before the Court of Claims.

### COMPTROLLER'S DECISION NOT CONCLUSIVE

The opinion of the Comptroller above referred to was given as an advance opinion to several disbursing officers. This will govern the action of all disbursing officers for the future, but it is not conclusive even in the Comptroller's office. The matter can be brought before the Comptroller again upon a claim duly presented by any contractor. This claim must be filed with the Auditor for the War Department and will be disallowed by him and then appealed to the Comptroller. The Comptroller will then hear legal argument upon the merits of the question. The opinion already rendered will be considered by him as *prima facie* correct, but he will not hold it to be finally binding upon him, if convinced to the contrary by any arguments then presented to him. There are numerous precedents for the Comptroller reversing in a claim thus brought before him, an advance opinion rendered to a disbursing officer.

### CAN APPEAL TO COURT OF CLAIMS

Should the Comptroller decide this test case favorably, the other claims will be paid. If the Comptroller adheres to his unfavorable decision, a test case can then be taken before the Court of Claims. If the Court of Claims decides in favor of the contractor in the test case, the Comptroller will probably reverse his decision and allow other claims of the same nature, if they have not already been brought before him and adversely decided.

### CAN FORCE U. S. TO BRING SUIT

It is also possible to test this question by insisting upon a suit being brought against a contractor by the United States. It may be thought best to take this course, but at present it is thought best to make the test by a suit in the Court of Claims.

### CONTRACT ALREADY BARS REFUND

It is not probable that any contractors

(Continued on Page 410.)

## Lumber and Service

"Job lots and bargains are all right when you are buying collars or shoestrings," said the Old Man to his junior partners, "but if we decide to build this year, I want to know beforehand who is going to furnish the lumber. If this new addition is to be finished by winter, we shall need something beside flooring and shingles—we have got to have SERVICE."

And so the Old Man insisted that all the lumber should come from Lloyd—for he had had experience; he had paid a high price for it.

Can you make use of his experience in your building plans, or do you feel that you must have some fresh experience of your own?

1919. Sealed Proposals will be opened in this office at 3 P. M., July 31, 1919, for the remodeling of an electric passenger elevator in the United States post office, courthouse, and custom house at Providence, R. I., in accordance with the drawings and specification, copies of which may be had at this office in the discretion of the Supervising Architect. James A. Wetmore, Acting Supervising Architect.

### BOND PREMIUMS ON GOVERNMENT CONTRACTS

(Continued from Page 401.)

will be pressed for payment of premiums already paid to them under settled contracts unless a decision should be rendered by the Court of Claims adverse to them. Such a result is not expected. If that is adverse, there will still be an opportunity for defense to such claims under the provision of Article IV of the contract providing that the monthly statement of costs and "all payments made thereon shall be final and binding upon both parties hereto."

### UNITED ACTION ESSENTIAL

This Association expects to take up this matter as an Association matter on behalf of the contractors interested. Nearly all of them are already members of the Association, and it is hoped that all others interested will join the Association in order to bear their fair share of the movement. It is very important that contractors should leave the handling of this matter to the Association, as independent action may interfere with the orderly handling of the test case in the manner above outlined.

### SEND INFORMATION TO SECRETARY OF A. G. C.

All contractors, whether members of the A. G. C. or not, are asked to send to the Secretary, 111 West Washington Street, Chicago, Illinois, copies of their correspondence on this subject, both letters received from the officers of the Government and their replies.

chaos of the industrial period, are by no means the ideal 'home,' as any inmate can testify, and rows of houses in rows of streets in their way, are almost as undesirable as congested 'model dwellings.' Happily, those 'who know' are engaged, the world over, in educating public opinion, and, based on truer conceptions of home, town planning in all its best phases is coming rapidly to be a necessity, recognized more and more as an obligatory requirement."

Home has happily been depicted as the center, though by no means the boundary, of human affections. The setting for that home is usually conceived of as a house, and the problem is to get that house to truly express the owner's best concept of home, to get it at the cost that he can afford, and get it when he needs it. With many that time is now! The cities are crowded, and dwellings are growing more and more scarce. What is the solution?

Locally, the tendency has been to meet the complexities of living by reducing the routine work, the rent, etc., by exchanging home for existence in a "downtown" hotel or apartment. But this, at best, is a makeshift, and even the lure of an automobile to carry one abroad, or of the "night life," which will soon be on the wane when divorced from liquor, will prove inadequate substitute for a real fireside. Also, the down-town apartment and hotel life in the large cities especially, is becoming abnormally expensive, and a revolt is doubtless in store for the operators of cramped community housing schemes to face.

The realty men are already hard pressed to fill the demands for detached dwellings, and architects and contractors are busy in planning and estimating new ones. But in far too many instances the item of cost is found to be too great and is taken as a real stumbling block so that construction is postponed or abandoned. This is peculiarly unfortunate, as it will be far more difficult to again arouse that spontaneous enthusiasm that is prevalent today which is dulled by this anti-climax.

Examine the situation as to building costs, and it is readily seen that they can be grouped under the headings of labor and materials. Nearly everybody agrees that labor will not be cheaper for several years to come. Just now the tendency is decidedly upward, as may be noted by the recent announcement that after July 1st Union carpenters in San Francisco are to have \$8.00 per day. And the carpenters usually lead off in any wage demands, so that we may expect

## "BUILD YOUR HOME NOW!"

BY HENRY H. GUTTERSON, Architect.

Following, as it does, the long period of building stagnation due to war conditions, the present revival of interest in building makes a special appeal to the home seeker. Among those whose home requirements have been upset by service-in-arms or hastened into being by reason of that service, there is a real enthusiasm based on a more and more acute need the whole world over. These home seekers, and they are legion, are looking longingly at the "labor problem," so-called, measured as it is in costs—wages and manufacturing costs—and hoping that the Government's present building campaign may yet evolve something of a practical nature to solve their problem. They desire to "build now," in other words, but apparently find conditions adverse and suggestive of delay, hesitation and doubt. Their hopes should be proven well founded, even at the cost of great and unique efforts on the part of the Government.

The genuine desires for a home, to say nothing of the equally genuine and general desires for activity among the millions dependent for a livelihood on the building trades and manufacturing of materials, are normal, inherent desires; instincts not to be put down lightly; and inseparable from this greatest of all present-day social problem, called the Labor

problem. Perhaps no truer statement regarding the prevalent labor unrest has been made than that its solution lies along educational lines, in stimulating feelings of responsible citizenship among all classes. And how better can this be done than by making them the owners of their homes? "Bolshevism," so-called, or other forms of unrest based on the desire to overturn through violence, cannot thrive among those who own property, for with them destruction becomes suicidal.

A prominent New York architect has recently advocated "standardization" as a means to meet this demand for dwelling. But, although this would naturally tend toward reducing costs, it would overlook that all important distinction between a home and a house that in the end is of most vital importance if the solution of the problem is to be permanent. Recently King George of England, himself a large landlord, in addressing the building authorities in London, said on this subject:

"'Homes' is what is required, not merely 'houses,' and it is exactly in the ratio in which the average citizen discerns the full value of the essential difference that government building schemes will bear fruit of real quality. Barrack 'model dwellings,' no doubt a step out of the

We have pebbles all sizes. Cost less than what you are using. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

it will soon become a general increase. So this item of labor, which is always a very large one in building operations, is admittedly on the increase.

Materials, on the other hand, are expected by the average man to drop in price. But how can they drop? What are building materials? The actual stuff from which they are made makes up but the smaller portion of their value. Bricks, glass, lumber, metal work, plumbing, hardware, etc., have certain material, native values; but it is the labor put into them that makes them useful, and that labor is not going to be cheaper! It was estimated at the last conference of Developers of High Class Residence Property, assembled in Birmingham, Alabama, that at least 85 per cent. of the price of building materials could be classed as labor—labor of manufacture and transport—and that in the average house the cost directly attributable to materials was not in excess of \$750.00! In other words, the man who desires or needs a home now is being snared by false appearances to postpone it on account of the possible but not probable drop in price of items aggregating not over \$750.00. He is allowing his young married life to slip away, his children to be handicapped or his enjoyment of home to be postponed till it is almost too late for the best returns, because of false reasoning, or a lack of reasoning. When this condition is multiplied, as it is, in all classes and in all communities, it becomes almost a menace, hand in hand as it is with social and industrial unrest among those very people who most need to have homes. It is but one of those subtle suggestions that would keep the world from again becoming normal. Hence the Government's educational campaign looking toward keeping this labor active, and hence the need for individual effort toward building.

The Government posters are bringing out many helpful facts, among which are these: that a man can borrow money on his equity in a home, whereas on rent he cannot; and it is a duty to country, family and self to own a home; and, to the workers, "One good turn deserves another; good work here will encourage others to build." It is also a fact that on income tax returns loans for home buildings are deductible, and interest payments thereon tax free. These and many other facts combine with the loosening money market to prove the necessity for adjusting ourselves to a higher scale of values, forgetting that world that the war has swept away for all time; recognizing the real value of all

lines of work and the right of the worker to a home. The Government is making efforts toward any financial and industrial adjustments which may prove necessary toward these ends, and our support of these efforts must help bring results.

Finally, with our courage up and finances adjusted, how important it is to build in the best way we can afford. Good construction has always proven itself a worth while investment. When that investment involves the setting for the center of our affections it should allow for progress. Our house should be a substantial, adequate, artistic background for the expression of our development. How could it be better set than in a garden with a free space and sunshine on all sides—a garden home. Build now!—*Architect and Engineer.*

### WILL OWNERS TAKE A "SPORTING CHANCE?"

Cannot the architects convince their clients that it is at least worth while to take a "sporting chance" right now and have plans made and the bids taken? And pay the architect for his trouble besides! This relatively small expense is the only "chance" the owner takes in the matter, as the contractors, while stating that they are wasting their time to some extent in figuring jobs that never go through, are yet willing to continue doing so because it is clearly to their best interest to assist in the resumption of building activity. Every job that is figured does not fall flat; a good percentage of them are ready to be signed up, and this percentage is steadily increasing.

It simply means carefulness must be exercised on the part of the architect in conserving every item possible in plan and design; in not making absurd guesses for the owner's benefit. To induce the owner to take a "sporting chance," so to speak, in getting the plans under way and compensating the architect. The contractor will do his level best to land the job. The result, among other things, will be a closer getting together between the architect and the contractor, in the wholesome endeavor of getting the job through, and on the whole a more outspoken and practical view of the whole transaction on the part of owner, architect and contractors.

It is up to the dealers to do their level best—and the question has arisen, and is a serious one. Are they doing so?—*Building Review.*

## The Page "Ad"

"I like the clean, outstanding appeal of the page ad," said an advertiser recently, "but I'll be frank to say that I've never been able to convince myself that it can be made to pay."

"Have you ever tried out a whole page?" he was asked.

No. He hadn't. But he knew what a page of space would cost, and he couldn't get away from a certain overhang of doubt that the additional results would prove commensurate with the extra outlay.

We mentioned Wanamaker, who uses a page a day regularly, varying this program now and then by making it two pages.

Oh, yes, of course. But then Wanamaker's case was quite different.

We asked him to point out "how" and "why."

The truth of the matter is that the page ad is just as much more effective than the small ad as the big show window is more effective than the small show window.

To be sure, in the case both of the ad and the window a whole lot necessarily depends on just what you put into them and how you dress it up.

It wouldn't be good business to buy a page of space in order to work off a string of poor sales-talk.

But, assuming that the sales-talk is "right" and the article it is designed to sell an article that has real merit and utility, the page ad is actually the short cut to results.

The first object of any ad is to get the attention of the reader.

Nothing does this more effectually than the page announcement.

We have in mind an advertiser who slips a page space into his regular schedule now and then just as an interest-reviver.

He tells us it pays big.

Whether it would pay as handsomely in your case, we are not in a position to say.

Why not try it out?

The cost is not excessive.

Call Mr. L. S. DeLone.

Bell Phone, Diamond 209

Keystone, Park 1478

## Bricklayers, Masons, Plasterers

### DO YOU

use the hod carrying  
method of elevating  
brick, mortar, cement,  
etc.? It's too old fash-  
ioned—too slow and cost-

ly—for present day building work.

"LITTLE GENERAL" MATERIAL ELEVA-  
TOR HOISTS are used by dozens of bricklayers in  
Philadelphia, who used to rely on the hod carrier  
method, which was expensive and unsatisfactory.  
Now they use a "LITTLE GENERAL" and save  
money.

Several bricklayers have told us they saved the  
price of the "LITTLE GENERAL" on the first job.

"LITTLE GENERALS" in Philadelphia stock  
ready for immediate delivery.

One man to load the elevator, one man to dis-  
tribute the barrows and one man at the hoist will  
keep fifteen bricklayers hustling.

Elevator operates in  
an opening 26" x 60".  
Easy to erect, easy to  
take down and move,  
convenient to store.

Phone for prices and  
special discount.

## No More Ashes To Lug

No clumsy pan to spill dust  
and dirt on the kitchen floor

### The Glenwood Ash Chute

solves the problem. It is located just  
beneath the grate and connected by a  
sheet iron pipe straight down through  
the kitchen floor to ash barrel in cel-  
lar. No part is in sight. Not a par-  
ticle of dust can escape. Just slide  
the damper once each day and drop  
the ashes directly into the ash barrel.

### The Dust-Tight Cover

to barrel is another entirely new  
Glenwood Idea and is very ingenious.  
This is only one of the splendid im-  
provements of the new plan

### Cabinet Glenwood

the Range without ornamentation or fancy  
nickel, "The Mission Style" Glenwood. Every  
essential refined and improved upon. This  
Range can be had with the latest and most  
improved Elevated or End Gas Range attach-  
ments. It can be furnished with fire box at  
either right or left of oven as ordered. Our  
handsome booklet tells all about it.

## As The Editor Sees It

THE semi-annual report of building operations in Philadelphia, published in full on another page of this issue, is tangible evidence that construction work is under way and that the prophesied building boom is near at hand.

Nineteen-eighteen outclassed all previous low building records with the total value of building only \$15,452,670. Total operations for which permits in the first six months of 1919 were issued amount to \$21,982,990, and this before the building industries have had a chance to adjust themselves to new conditions.

The most notable increase is in the number of two-story dwellings. Of these, there were erected during the year 1918 only 884 at a cost of \$2,885,710. During the first half of 1919 there have been started 2,395 two-story dwellings at an estimated cost of \$10,147,400. This represents practically half of all money spent in construction work during the first six months of this year, and is indicative of the great demand and need for homes for the average working man.

In 1918 there were erected 62 three-story dwellings at a cost of \$403,000. The first half of 1919 shows a big increase here also. The number of three-story dwellings during this period being 340, at an estimated cost of \$2,552,915.

The total new buildings from January to June, inclusive, is 3,610, estimated cost, \$17,305,960 against a total for the whole of 1918, of 1747, at a cost of \$9,260,015.

These conditions are not confined to

Philadelphia. From Boston comes the report that labor troubles in the building trades, which for some time have seriously threatened the Boston construction program, are being settled by arbitration and it is gratifying to note that in spite of these difficulties between contractors and carpenters, the Building Commissioner of Boston for the first five months of 1919 issued a total of 2,163 building permits for work valued at \$6,584,504, this being an increase by one-half over 1918 figures. Some of the wholesale men and retailers in and near Boston say they are not surprised by the advance in building material prices; others declare this increase has come sooner than they had expected, although it was looked for during the summer. Buyers have learned from bitter experience in this section, as everywhere, not to delay even though prices are higher. Some stocks are almost impossible to procure now and the export demand is brisk.

Building statistics for 164 cities for May compare very favorably with the best in the last five years. Only in May, 1916, were the figures larger. The total is about 300 million dollars for the five months of 1919. The average value of permits for May was \$2,614 compared to \$1,700 in January, showing that the ratio of new building to repair work is increasing. Chicago permits were for seven millions for May and New York and its boroughs show a total of about nineteen million.

It seems likely that the present volume of activity will continue for three or four months to come. Toward the close of the building season it is possible that the amount of contracts awarded may show a slight decline. However, judging from the amount of building needs not yet taken care of and the enormous increase in activity that has been witnessed during the first six months of the year, it would appear that 1919 will go down in the history of construction activities as a banner year. In view of the uneasiness with which the public viewed the business situation in January, the rapidity and the extent of the recovery have been remarkable.

Activity in Eastern Pennsylvania, Southern New Jersey, Maryland, Delaware and Virginia, shows an even larger percentage of gain, contracts let between January 1 and June 30, this year in this territory, amounting to \$171,435,000, an increase of thirty-six per cent. over the average for the corresponding periods of the preceding five years. This average, expressed in terms of 1919 values, was \$121,000,000. In fact, the 1919 total to date is greater than for any similar period, except 1918, when \$228,000,000 was reached. Nearly half of this, however, was for Government work.

Of the total for this year to date in the territory under consideration, fifty per cent. was for residential work, and thirteen per cent. industrial.

**P**ASSAGE of the loan bill authorizing the city of Philadelphia to borrow money for installation of sewers and street improvements, although the bill will not allow so large an amount to be expended as had been deemed advisable, will help materially the operative builders.

While none of the men, says "The Press," who have built and are willing to continue building Philadelphia is entirely satisfied with the loan bill which passed City Councils last week, because the amounts they believed to be absolutely necessary for street improvements, such as main and branch sewers, and water mains, etc., were pared down materially, all concerned feel relieved to a degree because it will now be possible to continue development here, and they will not be forced either to go out of business or seek other fields of endeavor.

The matter from the standpoint of the Philadelphia Operative Builders' Association is a plain business proposition, in which the municipality has by far the greater interest. The construction of a house, they point out, means increasing the taxable value of the lot it stands upon, at least tenfold, in some cases much more. Instance after instance might be quoted in support of this statement, but it is sufficient to point out that a block of ground in West Philadelphia paying taxes on a valuation of \$25,000 as vacant land, is now assessed and pays taxes at the city, or highest, rate of taxation on a valuation of \$250,000 since improvement by the construction of dwellings.

Improvement of vacant land also means not only an increase in municipal revenue from increased taxation, but also an increase in the city's borrowing capacity. This increase amount to 10 per cent. of the assessed value of real estate within the boundaries of the city under a recent amendment to the Constitution, and consequently every dollar of value created by the builders means that another dime may be borrowed by the city for permanent improvements, as well as two and thirty-five hundredths cents in the municipal coffers for current expenses.

In this connection it may be pertinent to point out that \$7,354,625 was added to the value of real estate in Philadelphia last month by the builders. More than half of this sum, or \$4,688,750, to be exact, was the direct result of the activities of the operative builders, as this amount was invested by them in the construction of 984 houses, 868 of which were of the two-story type which has become so popular in this city in the last twenty-odd years or so.

As the result of this single month's activity among the builders taxable value

has been added to city real estate equal to the amount expended in improvements, while the city's borrowing capacity has been increased \$735,462.50

In view of these facts the builders are at a loss to understand why there should have been any question raised in Councils as to the propriety of passing the loan as it stood originally, as failure to provide for new street improvements immediately meant the suspension of dwelling construction in this city until such time as a new loan could be passed and negotiated, for the supply of available building land where street improvements are in is frowning less and less with every new house built, and when all should have been used up no more building of houses would be possible.

Available lots amounted to about 3,200 to 3,500 at the beginning of this year, and at the rate dwelling construction has been going on within the last month these would have been exhausted within another month or so. Then the builders say construction would be forced to stop, be-

cause while it would be possible, perhaps, to build facing on streets in which there are no improvements, it would be neither practicable nor profitable, because the houses could neither be occupied nor sold. The health authorities would not permit occupancy of a house where there is no drainage, and for this reason there would be no buyers. Therefore, no one would be willing to take a chance of drainage and water being put in before carrying charges ate up all prospective profits and more.

It is probable now, however, that a beginning at least will be made in the construction of sewers and the laying of water mains sufficient to enable the builders to carry on to a limited degree and to tide themselves over until conditions become normal.

It is urged by the builders that the construction of sewers and the laying of water mains considerably in advance of immediate house construction needs should be made a permanent municipal policy for the future.

## BUILDING COMMANDS!

The Pressure of Demands is Growing Stronger and will Prevail

By Allen E. Beals

If you will place your eye to the country's periscope you will glimpse the immediate future of building. We are in a trench of uncertainty. The knoll, behind which we are still crouching, is the rising cost barrier. No-man's land is the shortage in the national supply of building materials. The barbed wire entanglements are labor troubles and the low hanging cloud above is the slow money market. But the glowing sky at the horizon is the country-wide need for new buildings. It is the sign of promise.

Scientists tell us that the unseen sun far beneath the curve of the earth sends its rays upon atmospheric atoms which, reflecting them, project the rays in a glow upon the earth. This we call sunrise. It is the symbol of the nation's construction future. The demand is rising, like the sun.

While there is turmoil over labor, costs and scarcity of materials and money, there is a mighty power developing that no effort of man can successfully combat. That power is Demand. All the forces of financial manipulation is not sufficient in this country to balk the might of a universal cry for adequate shelter. It is the glow in the eastern sky.

Building construction has its boom when it is more profitable to build than to put the money into stocks and bonds.

Just at the present time quicker and bigger profits are being taken out of stocks and bonds.

In the greater cities realty investors freely admit that with building costs high they have sought to increase their building funds by making rail, industrial and mining investments. Many lambs have, incidentally, been led to the slaughter and there will be no construction from their funds, that is, upon the site originally intended. Great insurance companies, whose attitude on building loans influences the opinions of lending officers of savings banks throughout the country, have taken heavy engagements of Government bonds. Many others who have had money saved for the purpose of building prior to or during the war, have thought best to put this money into business expansion, hoping, by larger earnings from these sources, to hold out for a more favorable time for building. But they are discovering that there is no time like the present.

In every instance the trend now is to provide for building construction upon the original, or even larger plan. The man who planned a \$10,000 home and finds that his \$10,000 will now buy only a \$6,000 house, is not proceeding with the \$6,000. He is trying to add not \$4,000, but \$5,000, to his original fund

(Continued on page 431)

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

**Distributing Building**, Roosevelt Boulevard, Whitaker, Summerdale and Wakeling streets, Frankford. Architect, private plans. Owners, Sears, Roebuck & Co., Chicago, Ill. Brick, steel and concrete, size of lot 37 acres. Plans in progress. Too early for details.

**Bank Building**, Northwest Corner Fourth and Lombard streets, Philadelphia. Architect, J. Horace Frank, Real Estate Trust Building, Philadelphia. Owner, M. L. Blitzenstein, Northeast Corner Fourth and Lombard streets, Philadelphia. Indiana limestone, brick and marble, stone foundations, slag roof, 1 story and mezzanine, 27x45 feet, yellow pine and terrazzo floors, hot water heat, electric light, marble and terrazzo work, mill sash and frames, bank fixtures, metal lath, reinforced concrete vault. Architect taking bids due July 17th. H. E. Batton, 1713 Sansom street; F. B. Davis, 240 North Sixteenth street; E. E. Hollenback, Inc., 1804 Brandywine street; F. A. Havens Co., 845 North Nineteenth street; Wm. C. Doll Co., 201 North Broad street; William R. Dougherty, 1610 Sansom street; A. R. Raff Cont. Co., 1635 Thompson street; B. Bornstein, 1510 North Franklin street; H. G. Campion, Otis Building; Lam Building Co., 1001 Wood street, and Jacob Myers & Sons Co., Witherspoon Building, figuring.

**Sales and Service Building**, 1425 North Broad street, Philadelphia. Architect, LeRoy B. Rothschild, 1225 Sansom street, Philadelphia. Owner, Hartford Realty Co., 859 North Broad street, Philadelphia. Stone and frame, 1 and 2 stories, 30x160 feet, slag roof, tile floors, steel work, tile work, hollow metal skylights. Architect will be ready for bids in a week.

**Store (alts.)**, 1226 Point Breeze avenue, Philadelphia. Architect, Robert W. Pollock and Harry R. Rust, 1802 Chestnut street. Owner, Lawrence & Son, on premises. New front, marble work, plate glass, electric work, marble mosaic work, parquet floor, flush bulks. Architects taking approximate bid from F. W. Van Loon, Denekla Building.

**Residence**, Northwest Corner Park avenue and Eighth street, Oak Lane. Architect, Frank V. Nickels, 4400 Manayunk avenue. Owner, J. Goldman, Oak Lane, Philadelphia. Brick, 2½ stories, 26x45 feet, slate roof, hardwood floors, stone foundations, hot water heat, electric light, tile work. Architect will take bids in one week.

**Store and Apartment Building**, Thirty-fourth and Spruce streets, Philadelphia. Architect, Arnold Mueller, 1727 Bristol street, Philadelphia. Owner, name withheld. Brick, 3 stories, 20x78 feet, slag roof, pine floors, stone foundations, hot water heat, electric light, tile work. Architect taking bids due July 19th. Standard Const. Co., 1723 Sansom street, is figuring.

**Dwellings (64)**, Van Dyke street, from Magee to Hillerman streets, Philadelphia,

\$156,800. Architect, private plans. Owner, James S. Larzelere, 1132 Land Title Building, Philadelphia. Brick, 2 stories, 16x30 feet, slag roof, electric light. Owner will build.

**Dwelling (alt.) to Rooming House**, 5122 Germantown avenue, \$2,500. Architect, private plans. Owner, Fletcher, McNally, Boas Co., 5132 Germantown avenue, Philadelphia. General interior alterations. Owners will build.

**Residence**, Borbeck and Barnes streets, Fox Chase, Philadelphia. Architect, Christian H. Fries, 8129 Pine road, Fox Chase, Philadelphia. Owner, James H. Craig, 8104 D street, Fox Chase, Philadelphia. Stone and brick, 2½ stories, 35x46 feet, shingle roof, oak floors, stone foundations, hot water heat, electric lighting, tile work. Architect has received bids.

**Factory**, Unity and Oakland streets, Frankford, Philadelphia. Architect, M. Ward Easby, Crozer Building, Philadelphia (Cons. Engr.). Owners, Vigogne Mills, care of engineer. Brick, 3 stories, 63x240 feet, slag roof, maple floors, stone and concrete foundations, steam heat, electric light, (1) electric elevator, rolled steel skylights, mill work, (2) brick fire towers. Architect will take sub-bids.

**Mill Building**, Butler and Jasper streets, Philadelphia. Architect, M. Ward Easby, Crozer Building, Philadelphia. Owner, Windsor Mfg. Co., 4060 Orchard street, Frankford, Philadelphia. Brick (slow burning), 3 stories, 63x240 feet, slag roof, maple floors, stone and concrete foundations, steam heat, electric light, (1) elevator, rolled steel skylights, mill work, (2) fire towers (brick), (1) stair tower. Architect will take sub-bids.

**Garage**, Stenton, Philadelphia. Architects, Druckenmiller & Williams, 1527 Chestnut street, Philadelphia. Owner, Frank E. Harris, 242 East Walnut lane, Germantown. Brick, 1½ stories, 19x24 feet, hot water heat, electric light, tile roof, cement floor. Architects have received bids.

**Residences (8)**, Mt. Airy, Philadelphia. Architect, George S. Idell, 1705 Chestnut street. Owner, name withheld. Stone, 2½ stories, 28x34 feet, slate roof, oak floors, stone foundations, hot water heat, electric light, tile work. Ready for bids in a few days.

**Residence**, Fifty-third and Wynnefield avenue, Philadelphia. Architect, Frank Seeburger, 1524 Chestnut street, Philadelphia. Owner, Dr. Percy DeLong, 1909 Chestnut street, Philadelphia. Stone, 2½ stories, 20x45 feet, wing 15x16 feet, shingle roof, oak floors, stone foundations, electric light, tile work (heating and plumbing reserved). Architect taking bids due July 17th. Wills-Ludwick Co., 1708 Sansom street; J. E. Kearney, 34 South Seventeenth street; Milton W. Young, Overbrook, Pa., and Charles C. Pace, Merion, Pa., are figuring.

**Store (alts.)**, 1430 South street, Philadelphia. Architect, G. Edwin Brumbaugh, Real Estate Trust Building, Philadelphia. Owner, Venturi Bros., on premises. Changing partitions and general interior alterations. Will take bids in about one week.

**Garage**, Stenton, Philadelphia. Architects, Druckenmiller & Williams, 1527 Chestnut street, Philadelphia. Owner, William Thompson, care of architect. Stone, 1½ stories, 19x24 feet, slate roof, cement and pine floors, hot water heat, electric lighting. Architects have received bids.

**Building (alts. and add.)**, Fifty-third and Market streets, Philadelphia. Architect, H. B. Weldon, Fuller Building, Philadelphia. Owner, L. F. Calby, on premises. Brick, 3 stories, 17x21 feet, slag roof, yellow pine floors, metal lath, tile and marble work, electric lighting, stone foundations (heat reserved). Owner and architect have received bids.

**Garage (add.)**, 5113-17 Frankford avenue, Philadelphia, \$8,000. Architect, private plans. Owner, George McDonald, on premises. Brick, 1 story, 58x77 feet, electric light, cement floors. Owner will build.

**Bank (alt. and add.)**, Third and Arch streets, Philadelphia. Architect, J. T. Brugger, 5610 North Mascher street, Philadelphia. Owner, Union National Bank, care of J. S. McCulloch, president, on premises. Brownstone and brick, 3 stories, 15x40 feet, 18x16 feet, slag roof, stone foundations, electric light, tile and marble work, new vault, air cooling system. Architect will take sub-bids.

**Residences (2)**, Roxboro, Philadelphia. Architect, E. H. Yardley, 1713 Sansom street, Philadelphia. Owner, name withheld. Hollow tile, plaster and frame, stone foundations, slate roof, hot water heat, electric light. Plans in progress.

**Bank (alts.)**, 431 Chestnut street, Philadelphia. Architect, Adin B. Lacey, 1012 Walnut street, Philadelphia. Owner, Tradesmen's National Bank, on premises. Alterations to main entrance and screen, brick work, limestone, marble work, granite work, carpentry, mill work, plastering, metal lath, iron work, hardware, glazing. Architect has received bids.

## Lumber and Service

In a building operation everything must be on the spot at the right time. The first thing you need is SERVICE. The finest flooring in the world is of no use if when the men come to lay it you find it is stuck in a freight jam at Norfolk, Virginia.

The right kind of service avoids freight jams. When Uncle Sam was building, he called on us to help keep his lumber cars moving. So we have had a post-graduate course.

Fifty years' experience is at your service when you build, if you see that the lumber comes from LLOYD.

**WILLIAM M. LLOYD COMPANY**

Established 1868

29th and Ridge Avenue

PHILADELPHIA

555, \$94,700; 563, \$5,950.

**Motion Picture Theatre**, 1534-36 South street, Philadelphia. Architect, Frank E. Hahn, 1112 Chestnut street, Philadelphia. Owner, A. Wax, 1534 South street, Philadelphia. Engineers Office 4th Light House Dist  
 Phila June 26. 1855

C. W. French & Co.

S. W. Corner of 7th Avenue & Callumhill St

Gentlemen

I am prepared to accept your offer to furnish Hydrant Cement of the best quality, for the Absecon Light House, at the rate of \$1.50 - per barrel of 4-bushels, to be delivered in such quantities, and at such times as they are required - say within the limits of 50 - or 100 bbs per week.

Provide the above price of \$1.50 - covers all the expense of placing the barrels in the cars of the Camden and Atlantic Rail Road Comp'y, at their Depot in Camden New Jersey. It is estimated that from 800 - to 1000 - barrels will be required between this and the middle of October proximo.

Very Respectfully Yours

GEO. G. MEADE  
 Lt. General

( Note Date, Name and Address (same as to-day). "Cement of the Best Quality" (to-day, French's). Absecon Light House, Atlantic City, N. J. Signature, GEO. W. MEADE, later General who won Battle of Gettysburg, 1863. )

## An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

## ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

I., in accordance with the drawings and specification, copies of which may be had at this office in the discretion of the Supervising Architect. James A. Wetmore, Acting Supervising Architect.

### BUILDING COMMANDS!

(Continued from Page 418.)

so as to build even better than he originally planned.

The best part of a year has passed

since the armistice was signed and money has been in greater circulation than ever before. The astonishingly small number of business failures attests the fact that the country is prosperous to an exceptional degree.

Did anyone ever know of low prices during an era of prosperity?

The skilled labor situation is becoming daily clearer and the unskilled labor situation daily more dismal. That means a larger use of labor-saving machinery and a relocating of floating skilled labor. This implies the greater concentration of skilled artisans, whether they are employed on the building, on engineering work or factories, resulting in steady occupation. Industry well occupied means continued free circulation of money, causing greater activity, the re-opening of other factories and mills and with the re-opening of these factories and mills, warehouses, terminals, office buildings, hotel, theaters and homes will be in demand and must be built.

The periscope reveals a golden tinge to the horizon as the rising sun of prosperity reaches its level with the top of the earth. It is the flow of interest from debtor nations abroad, of returns from harvested crops, larger than the country ever has known; it is the turnover of industry reaching out to grasp a world market and lastly, it is the flood of investment money from the intangible securities of Wall street to the actual and permanent investment of real estate improvement.

No legislative power can force money into unproductive channels. Until the turn of the first half of the year real estate has not been an immediately productive channel of investment, compared with the glitter of a "million-a-day" security market. New York and Illinois, as well as other states, have been trying to legislate the cork into the Wall street investment bottle, but with small success. When the time comes investors will realize the true situation and then building will come into its own.

That time is here. The sun has risen. Building is on its way.

The nation knows that there is actual danger in further deferring construction work. Costs will not recede. Instead, they will advance in exact ratio to the amount of building that is deferred. The fewer building products used, the more building material plants will close, thereby putting premiums upon the products of the plants that do operate.

So investment money is now being taken from Wall street and put into commercial, industrial and special types of income-producing structures, like hotels, theaters in larger quantities, not because of coercion or from any philanthropic desire to provide shelter for the victims of high rents, but because the condition of under construction, in an eight months' try-out, has been proved to be actual. In other words, the demand for building investment has been shown to the satisfaction of investors because the rate for building money is slowly rising above the profit-taking level in Wall street.

It is a start. Some still think it is a false start. Nevertheless, the effect of the signing of the Peace Treaty upon money and investments, building material supply and labor, must be so enormous that it cannot even be guessed.

One of the greatest problems that time only can solve is the adjustment of the relations between capital and labor. The recent convention of the Federation of Labor placed the organization on record as determining to work out its problems on American lines. It must devolve upon the responsible chiefs of the labor movement to bring about a realization that collective bargaining can never dissolve the inborn desire of individual competition. The inequalities of men themselves must eventually be recognized by the rank and file. It is upon this principle that collective bargaining must do its planning in future if it is to use its power constructively.—*The National Builder*.

## As The Editor Sees It

WITHOUT doubt the great demand for homes and buildings of all kinds must be met today, in spite of the scarcity of labor and materials and the attendant high prices. The only answer to the problem confronting the architect and the contractor is increased efficiency, and concentrated effort in overcoming the difficulties confronting them today.

An influential factor in today's crisis is the "Associated General Contractors of America." This body aims to promote better relations between private owners and public bodies, their architects or engineers on the one hand, and contractors on the other; to maintain high professional standards in the conduct of work; to combat unfair practices; to encourage efficiency among contractors; to support contractors and contractors' associations in efforts to rectify conditions of an unsatisfactory character; to encourage those methods of contracting for work which relieve the contractor of improper risks, and to encourage sound business methods tending to raise the standing of contractors generally in the business world.

The Association will publish a weekly and monthly paper; the weekly addition for members only. The first issue appears this month.

A little incident related in this issue is evidence of the extent to which the Association may use its influence. Within the past month the attention of the secretary was directed to the fact that one

of the members of the A. G. C. who was low bidder on certain public construction was in danger of losing the contract through a cancellation of all bids on account of political influence. The Secretary at once wrote the Chairman of the Board under whose jurisdiction the award was made in part as follows:

"The membership of this firm in the Associated General Contractors of America is not only an evidence of their skill, honesty and responsibility, but also a guarantee that the members of this Association will do all in their power to help others to maintain high professional standards in the conduct of work; to combat unfair practices; to support contractors and contractors' associations in efforts to rectify conditions of an unsatisfactory character and in other ways to secure justice and fair dealing in all questions affecting the members of this Association."

The general contractor member was awarded the contract, and it may be that the influence of co-operative effort had some bearing in securing fair play.

Discussing the problems which the architect must face today, Mr. Charles H. Hammond, President of the Illinois Society of Architects, says that the architect must make his service more valuable to the public. Several things may be done to accomplish this according to Mr. Hammond. He recommends intelligent effort on the part of the architect to urge upon labor a standard of better

workmanship; standardization in the building industry; putting students on the job, in connection with their school training.

### HOME LOAN BANK SYSTEM AND HOME FINANCING

One imperative need in the United States now is home building money.

The nation has more money than ever. There is a tremendous home owning sentiment. The need now is to devise a way whereby this sentiment may be crystallized in action and the man who is determined to build and own his home may at once have the house so his rental expense may be turned to payments on his property and, augmented by savings from current income, enable him to climb to home-ownership by way of installment payments.

Unless banking interest, as now organized, can show that they are meeting the demands for home building loans with reasonable adequateness, any opposition they may exert against the new methods of providing loans is unjustified. If the banks, confronted by a new and very pressing problem, are unable to overcome the inertia of conventional methods and devise new and adequate methods of meeting the problem, the penalty will be that interests other than regular banker will meet the problem.

The movement for a system of Federal Home Loan Banks is beyond the preliminary stages. Senator Calder, of New

KEYSTONE PHONE, RAGE 614

**BLUE  
PRINTS**

York, has introduced in the United States Senate a bill to establish a Federal Home Loan Bank System. In the next few weeks we must decide whether or not we shall provide this needed financial machinery in time to be of assistance now when the demand for homes is unprecedented and the housing shortage is a menace.

Certain banking interests opposed the Federal Reserve legislation and the Farm Loan Act. It was not to be expected that the proposed Federal Home Loan Bank movement would escape opposition. Some of the savings banks are bringing pressure against the Calder bill and it may not be amiss to remind these of two facts:

1. The savings banks and trust companies are drifting away from the real estate market toward the more liquid business of the Federal Reserve banks; and

2. The Calder bill, admittedly, is but a working basis to start action in Congress and it may be so modified to include within its benefits, institutions other than the building and loan associations.

Some of the opposition to the measure takes the form of argument for accomplishing the desired end through amendments to the Federal Farm Loan Act. A study of the possibilities in this field brings up grave doubts as to the prudence of such action.

Those who advocate financing the purchase of homes out of current savings by amendment of the Federal Farm Loan Act rather than by enactment of a law framed especially for that purpose have their eyes fixed on a "method of issuing bonds," and do not consider either the purpose accomplished by the Farm Loan Act or the present civic and economic condition of the country which it is desired to meet by encouraging home building.

The Farm Loan Act was passed to encourage an industry. The proceeds of loans made under it were required to be invested in farm lands or for farm equipment, fertilizer, stock or buildings, or to liquidate indebtedness incurred for the same purposes; loans were made only to persons engaged in farming the property mortgaged. One of the three district directors was required to be a practical farmer, actually engaged in farming when appointed. In fact, it would be difficult to imagine an act more specifically referring to a particular industry.

The bill would have to be amended at approximately 280 points before it would apply to men engaged in any other industry, and before it could even be amended in substance to apply to present housing problems.

Its mechanism, however, created an organization of prospective makers of

farm mortgages, roughly parallel to the local building and loan association, which overcame the economic isolation of the rural borrower and permitted the accumulation of inconsiderable mortgages into bond issues of desirable proportions. It created as fiscal agents, Federal Land Banks uniform throughout the United States and Alaska, whose function was to receive farm mortgages and issue bonds against them. These banks were empowered to act as depositories of public money and financial agents for the United States Government, and their capital, income and reserve were exempt from taxation. The bonds they issued were also exempt from taxation and were declared to be lawful investment for trust funds, and banks of the Federal Reserve System were given qualified permission to invest in them, thus securing them a market.

The Home Loan Act is designed to aid in financing the construction of homes and to help those who have put in their period of probation and accumulated their "down payment" to begin the construction of their homes at once. And although it does this by providing for associations doing a building and loan business, a market for their assets similar to that provided for farm mortgages under the Farm Loan Act, the incongruity of combining these two subjects in one bill is manifest.

The bill introduced by Senator Calder omits reference to two pertinent sections of the Farm Loan Act. The first is Section 15, providing for the making of loans directly through agents of the Federal Land Bank without the organization of a farm loan association, in localities where no National Farm Loan Association has been formed. A similar provision in the Home Loan Act would extend the benefits of its provisions to those communities where no building association exists.

The second section is Section 16, creating Joint Stock Land Banks, or banks formed by natural persons to carry on the business of lending on farm mortgage security and issuing Farm Loan bonds. Parallel activity under the Home Loan Act largely would cover dealing in mortgages on homes by savings banks, trust companies, and mortgage associations, and tend to draw money back into the real estate field by rendering its securities liquid.

As has been stated, there is no reason why the Calder bill should not be amended to include such features as are shown, by investigation, to be in the best interest of the country. As a matter of fact the building and loan interests, which had a hand in drafting the original bill introduced by Senator Calder, by a special committee are re-drafting

the bill and may ask the New York Senator to substitute the new for the old draft.

The fundamentals of the original bill have not been changed and whatever features are added, it is the opinion of those familiar with the field that these fundamentals ought not to be changed.

Mr. E. L. Keesler, President of the U. S. League of Building and Loan Associations, in commenting on the proposed bill, recently said:

"This measure is just because it will provide means for accommodating a very large class of our people who have been absolutely overlooked in all legislation hitherto enacted. Commercial interests are wisely provided for by the Reserve Bank. The Farm Loan Bank meets the agricultural needs, as it should, but, in so far as the Government is concerned, the mechanic, laborer, lawyer, minister, manufacturer, clerk or bookkeeper—in a word the town man—'must paddle his own canoe or drown.' The two great acts mentioned, with all their wonderful power for good, in that they omit the city or village man, are class legislation. The taxpayers and laborers in town have a just kick and will no longer take the medicine."

"This measure is needful, because in normal times the supply of money is totally inadequate for the demands of home construction and, in periods of abnormal demand for housing as now exists in many parts of the country, the situation is very greatly aggravated.

"It is needful because the present financial status of building and loan securities, consisting of first mortgages on the choice real estate of the land, is ludicrous. Country, municipal or school bonds secure funds, at times, at, say 4 to 4½ per cent., while the best securities on earth lie dormant in our vaults simply because there is no machinery for offering them for money, though the demand is imperative. The cry for funds to build homes is one that must and will be heard. Think of it, with millions of values at our command and having to borrow money at the HIGHEST instead of the LOWEST rates of interest! It is almost beyond belief that our government, interested as it should be, in the advancement and prosperity of its humblest citizen, should, for all these years, tolerate such an absurdity."—*American Contractor*.

\* \* \*

#### THE VALUE OF UP-TO-DATE EQUIPMENT.

An automatic dump truck not only saves money, but is a good advertisement for its owner. The builder who employs up-to-date equipment, inspires confidence in his ability to do a job quickly and well.—*Exchange*.

## PREVENTING DAMAGE BY WHITE ANTS

Unless checked they may cause serious injury to wood products and growing vegetation

Unless proper care is taken to make buildings white-ant proof, and to eliminate these ants from buildings already established, the insects may cause serious damage, especially in the Southern States, say entomologists of the United States Department of Agriculture in Farmers' Bulletin 1037, just published by the department.

White ants, or termites, are essentially wood destroyers, says the bulletin, and live in nests in the wood of dead trees, decaying logs or stumps in the forest; in the foundation timbers of buildings, fences, and other structures of wood in contact with the ground; or in a labyrinth of underground passages in the earth usually underneath wood or vegetation. An average colony contains several thousand individuals, but owing to their subterranean habits they frequently carry on their work unnoticed and it is sometimes very difficult to destroy them once they get established in a building.

### DESTRUCTIVE WORKERS RARELY SEEN.

Though colonies are made up of both wingless and winged individuals, the grayish white, soft-bodied, wingless workers are the destructive form. These workers make the excavations and live underground, shun the light and are therefore rarely seen. Always coming up through underground passages, they work in the interior of the wood, and leave intact a protective outer shell, so that the damage is often unsuspected until beyond repair. They gain entrance to buildings through wood which comes in contact with the ground. Flooring and other stationary woodwork and furniture frequently become infested when the wooden beams are laid directly on the earth or in moist concrete and are often reduced to more shells, the interior being completely honeycombed. Always the ants prefer to work in dark, warm, moist places.

White ants occasionally injure large trees and shrubs. In Florida they have done notable damage to newly planted groves of orange trees, having eaten the bark about the collar and roots and completely girdled the trees. Similar damage has been recorded to other fruit and nut trees, especially in the Southern States. In the South also these ants occasionally injure the stems and roots of a great variety of grain and truck crops. Injury to corn in the prairie region of Kansas has resulted from the early presence of the insects in enormous quantities in heavily sodded soil where they feed on the roots of the vegetation. There are

numerous records of ant injury to young fruit and nut tree seedlings in nurseries and to other nursery stock, and to young trees planted in recently cleared ground or soil rich in humus. The ants also injure a variety of shrubs, weeds, and flowers in gardens as well as in greenhouses.

### PROTECTING WOODWORK IN BUILDINGS.

Since white ants are difficult to eliminate from the woodwork of a building when once established, every precaution should be taken to prevent their gaining entrance. Where possible, foundations of buildings should be entirely of stone, brick, or concrete, including stone columns of pillars in the basement to support the floor above. Make the floors and walls in the basement or cellar of concrete and lay the floors on a gravel base. Where stone or concrete foundations are impracticable, use timber impregnated with coal-tar creosote.

Lay basement window sills and frames over concrete and do not allow the woodwork to come in contact with the ground. Never sink untreated timber in the ground or in moist concrete. No wood should be in contact with the ground. Completely dryness of the foundation and basement walls is an important means of rendering buildings safe from attack; therefore, provide for air spaces between the ground and wooden flooring, and see that the basement floors are well drained.

### ELIMINATING ANTS FROM BUILDINGS.

If white ants gain access to buildings, examine the foundation timbers and other woodwork in the basement and determine the point of entrance. After removing the damaged wood, drench the ground with kerosene oil, then replace damaged timber with rock, brick, concrete, or metal work, or if timber must be used, see that it is treated with coal-tar creosote. Since ants always require access to damp earth, shut off this source of moisture and the insects will not be able to extend their work further and will perish.

## ARCHITECTURAL SCALE MODELS

Berthold V. Gerow

About five years ago an article reviewing the annual exhibit of the N. Y. Architectural League, appeared in one of the Eastern architectural magazines. The writer, in the course of describing the work of different architects and artists on exhibition, said: "A feature, although but little accented, is the scale model, shown by several examples in this gallery. There can be no doubt that the laity will be better able to understand the appeal of a work of architecture when presented in this form, and it is hoped that there are more scale models in fu-

ture exhibitions. It is significant of the interest they create that visitors tarry longer in their examination of models than in the other architectural exhibits."

Five years ago a scale model was something of a novelty, but today it is recognized as one of the necessary adjuncts to the architectural profession. This is proven by the fact that scale models are very rapidly supplanting perspectives and rendered sketches as a means of portrayal and presentation.

There are several reasons for this—the principal ones are that to the architect they offer for all purposes a method of study that is unsurpassed. By their means the most intricate problems in architectural design may be easily and accurately worked out. Any weakness or defects in the design can then be quickly perceived and corrected, thus obviating the making of numerous unnecessary sketches.

Furthermore a scale model is the only medium (outside of the actual construction of the building itself) by which the third dimension can be accurately studied.

In most cases, however, it is to the client that the model renders the greatest service, for by studying the floor plans, etc., in conjunction with the model, he is able to see how his building will actually appear when completed.

Although most architects now recognize the value of the scale model and many of the larger architects employ a model maker in their offices continuously, it has been the writer's experience that a great many architects still labor under the impression that only where the proposed structure is to be of a very considerable cost and the architect's commission proportionately large, are they justified in having a model executed.

Models executed by the writer during the past year for architects were prepared for many and varied purposes such as exhibition, study, competition and presentation; in no case did the cost of the model exceed one-half of one per cent. of the cost of the finished structure and in most cases it was nearer one-fourth of one per cent.

While this rule may be applied to structures costing from ten to twenty thousand dollars or more it will not apply to buildings costing less. However, it is very seldom that even a perspective is justified on buildings costing less than ten thousand dollars.—*Architect Engineer.*

To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of unwise educational methods. Such people were not taught to battle with the world or meet life's emergencies.—Thoreau.

## Lumber and Service

"Job lots and bargains are all right when you are buying collars or shoestrings," said the Old Man to his junior partners, "but if we decide to build this year, I want to know beforehand who is going to furnish the lumber. If this new addition is to be finished by winter, we shall need something beside flooring and shingles—we have got to have SERVICE."

And so the Old Man insisted that all the lumber should come from Lloyd—for he had had experience; he had paid a high price for it.

Can you make use of his experience in your building plans, or do you feel that you must have some fresh experience of your own?

## WILLIAM M. LLOYD COMPANY

Established 1868

29th and Ridge Avenue

PHILADELPHIA

Thirteenth street, Philadelphia. Frame, 1 story and basement, 30x48 feet, slate roof, oak floors, stone foundations, hot water heat, electric light. Owner has received bids.

Our specialty is Portland Cement that will stick and pass the City Department. **DAVID FRANCE CO.,**  
Tasker Street Wharf, Delaware River, Philadelphia.

## Bricklayers, Masons, Plasterers

### DO YOU

use the hod carrying method of elevating brick, mortar, cement, etc.? It's too old fashioned—too slow and cost-

ly—for present day building work.

"LITTLE GENERAL" MATERIAL ELEVATOR HOISTS are used by dozens of bricklayers in Philadelphia, who used to rely on the hod carrier method, which was expensive and unsatisfactory. Now they use a "LITTLE GENERAL" and save money.

Several bricklayers have told us they saved the price of the "LITTLE GENERAL" on the first job.

"LITTLE GENERALS" in Philadelphia stock ready for immediate delivery.

One man to load the elevator, one man to distribute the barrows and one man at the hoist will keep fifteen bricklayers hustling.

Elevator operates in an opening 26" x 60". Easy to erect, easy to take down and move, convenient to store.

Phone for prices and special discount.

## As The Editor Sees It

**I**NCREASED production, as a means of reducing abnormally high prices, has been the urgent appeal from many reliable sources during the last few months. All are agreed that such production is absolutely necessary to the country today, and it now remains for manufacturers and material men to make concerted effort toward realizing this end. On Friday, July 18, resolutions were unanimously adopted by the Board of Directors of the National Association of Manufacturers at a meeting in the general offices in New York, urging public support of an effort to greatly increase the industrial production of the country, pointing out the growing tendency to restrict production on the theory that the less work a man does the more work he provides for others to do.

The resolutions declare that much of the industrial antagonism which exists between employers and employes is based on the unjustifiable and systematically fostered belief among the people that the manufacturers of the country are mainly responsible for the levels which prices generally have attained. Attention is also called to the fact that heavy war debt taxation has contributed heavily to present high prices and increased productivity is described as an effective means of shortening the duration of the war tax burdens now imposed on our industries and the individual citizen.

Factory workers are called upon to lend their aid to the manufacturers to the end that factory production may be

immediately increased, as a way of restoring reasonable and more normal price conditions. Legislative authorities, the press, the churches and educational institutions are also urged to give their co-operation to the movement for increased production as a means of relieving oppressive and economically unjustified present living conditions.

The resolutions, as adopted in full, are given below:

WHEREAS the question of high prices on many commodities of life has continued, since the cessation of military hostilities in France, to be of paramount importance to the people and industries of the United States, and

WHEREAS, there exists a well-defined effort among certain classes of our citizens wrongly and unjustifiably to disseminate the belief that the manufacturers and business men of the country are the principal and most reprehensible violators of the normal operation of the laws of supply and demand, and

WHEREAS, the burdens of taxation due to the war and other causes and levied on our citizens and industrial enterprises by the Federal, State and local authorities have become oppressively heavy and contribute in no small degree to the present high price levels, and

WHEREAS, high prices are largely due to the growth of tendencies among our labor elements to restrict and curtail individual and collective industrial production, a policy based largely on the false, pernicious and widely preached doctrine

that "the less work a man does the more work he provides for others to do," which, together with other unsound and uneconomic present labor tendencies, threaten to result in a lessening of the productive effectiveness of our American industrial machinery, and

WHEREAS, it is to the true welfare and interest of the people of the United States that our national industrial production be continuously increased so that our war debt taxation may be eliminated in as short a time as possible, more normal price conditions prevail and our industrial development and prosperity be stimulated: *Now, therefore be it*

*Resolved:* (1) That we deny the truth of and deprecate the tendency of the teaching that the manufacturers of the United States are the principal or deliberate authors of the present era of higher price levels.

(2) That we urge and call upon the people of the United States, and our factory workers in particular, to refute and discourage the un-American and dangerously unsound "make work" doctrine, which if pursued to any extent, will result in complete industrial demoralization.

(3) That we urge and call upon the people of the United States, and our factory workers in particular, to do everything in their power to encourage, stimulate and increase our industrial production, as the direct means toward restoring more normal price conditions.

(4) That we urge and call upon every duly constituted, Federal, State and local

agency of government in the United States to lend its aid to an effort to foster and increase our industrial production, promotion of harmony and discouragement of agencies and causes of discord and bad feeling between employers and employes, and relieve from every possible handicap the legitimate manufacturing interests of the country.

(5) That we urge upon the public press, the churches, educational institutions, and every other factor in moulding public opinion, to give all possible assistance in directing public attention to the urgent need for increasing industrial production.

\* \* \*

It is more than time now to get some action on the foregoing resolutions.

If we wait *too* long for the other fellow to start something, we may find it too late. We know how to improve present conditions and to meet the situation—immediate action.

From the National Lumber Manufacturers' Association comes the report that, as a result of the signing of the peace treaty, a more stabilized feeling and better sentiment is confidently expected by the business interests of the country without, however, any radical changes. Export trade especially should be less restricted, although the merchandise exports of the country have shown tremendous gains during the past three months.

The steady extension in building operations is shown in a brisker movement in house furnishings of all sorts and even greater gains are expected along these lines. Although lumber prices are high, the general situation is not satisfactory to the lumber producer. Production is low because of labor shortage, and, in some sections, because of floods and unfavorable weather, and lumber is scarce also on account of the sudden demand for stocks late this spring. Retailers and other buyers allowed their stocks to become very low, then rushed in large orders which the mills were unprepared to fill as promptly as desired. If prices are high now, it is largely because buyers are desperately naming their own terms, without caring what they pay so long as they get the lumber.

Agricultural conditions are generally favorable and business failures are few in number. In general, the quantity of business is estimated as about one fifth above what it was a year ago.

It is predicted on all sides that prices will remain near their present levels for the rest of the year, with some minor advances. With labor high, the only way to reduce manufacturing costs is by the further development of machinery and increased efficiency in manufacturing methods.

## THE ARCHITECT AS A CITIZEN

Remarks by

D. KNICKERBACKER BOYD, F. A. I. A.

At the 52nd Annual Convention of the  
American Institute of Architects

We are asked to say something concerning the status of the architect as a citizen. It seems to me that the first way for anyone to become a citizen is to accept the responsibility of citizenship. And any way that I look at it, this responsibility begins with consideration of the things which put us in touch with the heart-throbs of the people, and ends with the service which we can, and must give—the architect's service which makes it possible to reach into the homes of everyone of the people in this country.

You also asked that those who were connected with some of the Government activities, should say something about that phase of the architect's service. I hope that we will hear from Mr. Fenner tonight because he was the general manager of the United States Housing Corporation and we all owe to him a deep debt of gratitude. He will tell you that the word housing is, to a great extent, a misnomer. For housing embraces not only the single family abode, but all places intended for multiple dwelling, and includes all the necessities and amenities of living.

We found in our work for the Housing Corporation that we were immediately plunged into problems of engineering, of community planning, of transportation, of the production, manufacture and appropriate use of materials, of the consumption of fuel, of safety, of fire prevention and everything else which concerns the health, safety and the convenience of the occupants of dwellings. And it seems to me that we ought to have in mind all those phases of service and approach the subject from that standpoint if we would make the architectural profession of the greatest service to society, meaning thereby, mankind.

I will offer as concrete illustrations of what we might do in assuming the responsibility of citizenship, some practical recipes, so to speak. Each architect should first read and study the building laws of his city or of the state, if there are any laws of the state, and study them and the housing and sanitary laws affecting his practice and become thoroughly familiar with them, making no effort whatever to evade them, and absolutely discouraging on the part of any client any effort to evade or compromise those laws.

On the other hand, architects should

get in touch with the officials of their city or state who are responsible for those laws and endeavor to improve them if possible. That is also written in our own canons. Every architect should be familiar with the names and positions of those who are the governing officials in his city and in his state, and furthermore, his own representatives in the House and the Senate of the United States. I venture to say that there are very few architects here present who have a copy of the Congressional Directory in their library or in their files. And I offer the suggestion that each one of us should be supplied with a copy, so that we might, on any occasion, get in touch with the men that we, as citizens, elected to represent us in the National Capital.

It seems to me, that we should, as has so well been pointed out, keep in touch with all civic associations and other civic bodies, all chambers of commerce and similar organizations, that we should affiliate with engineering bodies and builders' exchanges and should co-operate in arranging for exhibits of building materials, and in doing anything which makes for a better understanding of the structural side of architecture. Also, that we should keep in touch with educational institutions, with home and school associations, that we should endeavor to have pictures of architectural subjects, examples of sculpture and other works of art placed in all public schools of the country. That we should endeavor to have lectures delivered in the various libraries and other places of public assemblage on architecture, painting and sculpture and the duties and responsibilities of citizenship.

That we should make them realize that an attractive house is a home which is a much more valuable asset than one which is ugly. That we should keep in touch with the building and loan societies of the country, who are responsible for the financing of the homes of the people. We should cause them to place a higher value upon a well-constructed house and we should keep in touch with the local insurance rating organizations and so design and construct our homes that our clients will have the least insurance premium to pay, as well as be afforded the opportunity to live in a well-constructed house, one that is safe for occupancy.

That we should keep in touch with  
(Continued on Page 462.)

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING;  
CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

**Bank and Office Building**, Northeast corner Broad and Walnut streets, \$8,000,000. Architects, John T. Windrim, Commonwealth Building, Philadelphia. Owner, Fidelity Trust Co., 325 Chestnut street, Philadelphia. Brick, steel, granite and reinforced concrete, carved stone, marble, tile and marble work, metal lath, iron work, 31 stories, 229½x175 feet. Plans in progress.

**Office Building**, Broad and Spruce streets, Philadelphia. Architect, not selected. Owners, Atlantic Refining Co., care of R. D. Leonard, 3144 Passyunk avenue. Details undecided. Work contemplated.

**Bank Building (add.)**, Passyunk avenue and Bainbridge street, Philadelphia. Architects, Magaziner & Eberhart, 603 Chestnut street, Philadelphia. Owners, State Bank of Philadelphia, on premises. Steel, stone, brick and terra cotta, 2 stories, 42x55 feet, slate roof, composition floors, marble work, metal lath, safety treads, rolled steel sash, rolled steel skylights, fire escapes. Architects taking bids due August 5th. William R. Dougherty, 1608 Sansom street; F. A. Havens Co., 845 North Nineteenth street; H. E. Grau Co., 1707 Sansom street, and A. Raymond Raff Const. Co., 1633 Thompson street, Philadelphia, are figuring.

**Garage and Mechanics' Shop**, Marston and Longshore streets, Philadelphia. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, Patrick Grant, care of Henry Disston Sons Co., Tacony, Philadelphia. Brick, 2 stories, 55x98 feet, stone foundations, slag roof, cement floors, hot water heat, electric light, tile work, metal lath, roof ventilators, (1) elevator, metal ceilings, ornamental iron work. Plans in progress.

**Store and Apartment**, Southeast corner Broad and Wharton streets, Philadelphia. Architect, Frank V. Nickels, 4400 Manayunk avenue, Philadelphia. Owner, John Reale, Tenth and Filbert streets, Philadelphia. Brick, 4 stories, 24x200 feet, stone foundations, slag roof, hardwood, tile and composition floors, hot water heat, electric light, tile and marble work, metal lath. Revised plans completed. Architect ready for bids.

**Residence (alt. and add.)**, Northeast corner Eighth and Boulevard, Philadelphia. Architect, Frank V. Nickels, 4400 Manayunk avenue, Philadelphia. Owner, J. S. Christie, 1345 Arch street, Philadelphia. Brick, 2 stories, irregular size, stone foundations, slag roof, oak floors, hot water heat, electric light. Owner has received bids.

**Apartment House (alt. and add.)**, 1703 West Diamond street, Philadelphia. Architect, Reuben Beard, 503 Liberty Building, Philadelphia. Owner, name withheld. Brick, 3 stories, 23x110 feet, 15x15 feet, stone foundations, slag roof, hardwood floors, hot water heat, electric light, mineral flooring, cement

work, galvanized iron bay windows, iron work. Architect ready for bids.

**Store and Dwelling (alt. and add.)**, 6114-16 Lansdowne avenue, Philadelphia. Architect, Reuben Beard, 503 Liberty Building, Philadelphia. Owner, name withheld. Brick, 30x80 feet, lowering floor 3 feet, electric light, steel work, flush bulks, galvanized iron work, general interior alterations. Architect ready for bids.

**Garage**, 739 Bainbridge street, Philadelphia. Architect, Reuben Beard, 503 Liberty Building, Philadelphia. Owner, Mike Green, on premises. Brick, 1 story, 20x60 feet, structural steel work, plumbing, skylights. Owner ready for sub-bids.

**Store and Apartments**, York road and Loudon street, Philadelphia. Architect, Joseph L. Tomlinson, 4806 North Camac street, Philadelphia. Owner, P. H. Brady, 1347 Mellon street, Philadelphia. Brick, 3 stories, 60x20 feet, stone foundations, slag roof, pine floors, electric light, hot water heat, tile work, metal lath, roof ventilators, rolled steel skylights, iron work. Owners have received bids.

**Stair Tower and Elevator Hatch (alts.)**, 406 Race street, Philadelphia. Architect, H. B. Weldon, Fuller Building, Philadelphia. Owner, Harry Tuttleman, 406 Race street, Philadelphia. Brick work, steel, iron stairs, carpentry, patching roof and plastering, galvanized iron skylights. Architect has received bids.

**Store Building (alts.)**, 716 Market street, Philadelphia. Architects, Simon & Simon, 249 South Juniper street, Philadelphia. Owner, Estate of John Dobson, 809 Chestnut street, Philadelphia. General interior alterations, new front, passenger elevator, steam heat, electric light, tile and marble work, new stairs, floors, etc. Architects taking revised bids from Standard Const. Co., 1713 Sansom street, and Warren-Moore Co., Colonial Trust Building, due as soon as possible.

**Tenement House (alts. and add.)**, Fifteenth and Catharine streets. Architects, Lachman & Murphy, Drexel Building, Philadelphia. Owner, William Bailey, Fifteenth and Catharine streets. Brick, 3 stories, 19x42 feet, slag roof, pine floors, stone foundations, steam heat, electric light, tile work, ornamental iron work. Architects have received bids.

**Residence (alt.) to Store, Garage and Apartment**, Southeast corner Sixty-third and Media streets. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, Fred D. Stiteler, on premises. Brick and stone, 2 stories, 16x101 feet, stone foundations, slag roof, hot water heat, electric light, hardwood floors, tile and marble work, metal lath. Architect taking bids due August 4th at noon. Christian Hansen, East Lansdowne, Pa.; LeRoy K. Smith, Forty-second and Chester avenue; Mitchell Bros., 2125 Race street; W.

J. Irwin, 5927 Kingsessing avenue, and J. D. Fisher, 5424 Thompson street, Philadelphia, are figuring.

**Dwellings (28)**, 4713-63 North Warnock street and Warnock street South of Loudon street, Philadelphia, \$134,800. Architect, private plans. Owner, Abraham Sonnenfeld, 287 South Sixty-third street, Philadelphia. Brick, 2 stories, 15x42½ feet and 15x28½ feet, 12x14½ feet, slag roof, hot air heat. Owner will build.

**Garage**, Southeast Corner Wakeling and Mulberry streets, Philadelphia, \$4,000. Architect, private plans. Owner, Edward Smith, 4923 Hawthorne street, Philadelphia. Brick, 1 story, 38x99 feet. Owner will build.

**Dwellings (24)**, Oxford street, Sixtieth to Sixty-first streets, Philadelphia, \$205,000. Architect, private plans. Owners, Oler & Shapiro, Fifty-seventh and Master streets, Philadelphia. Brick, 3 stories, 16x48 feet and 16x21 feet, 13x22 feet, slag roof, hot water heat. Owner will build.

**Residence and Garage**, Seventh and Cheltenham avenue, Philadelphia. Architect, Alex. M. Adams, 1012 Walnut street, Philadelphia. Owner, name withheld. Stone, 2½ stories, 33x39 feet, wing 13x18 feet, garage, 1 story, 20x20 feet, slate roof, oak, pine and cement floors, hot water heat, electric light, tile work. Architect has received bids.

**Apartment House**, 5114 Camac street, Philadelphia. Architect, Edwin L. Rothschild, 1011 Chestnut street, Philadelphia. Owner, Bertha G. Modell, care of architect. Brick, 3 stories, 28x36 feet, slag roof, oak floors, hot water heat, stone foundations, electric light, tile and marble work. Architect has received bids.

**Residences (44)**, McKean and Bonsall streets, Philadelphia. Architect, E. Allen Wilson, 1218 Chestnut street, Philadelphia. Owner, name withheld. Brick, 2 stories, 17½x32 feet, slag roof, hot water heat, electric lighting, stone foundations. Plans in progress.

**Stores (alts.)**, Fifty-second and Girard avenue. Engineer, L. E. Denslow, 44 West Eighteenth street, New York City. Owner, United Cigar Stores Co., 44 West Eighteenth street, New York City. Carpentry, plumbing, metal work, painting, marble work, mill work, hardware, tile work, plastering, metal lath. Owner taking bids due July 31st. Smith-Hardican Co., 1606 Cherry street, is figuring.

**Twin Residences**, Sixty-third and Overbrook avenue. Architect, Arnold Mueller, 1727 Bristol street, Philadelphia. Owner, Mrs. White, Overbrook, Philadelphia. ## Lumber and Service

In a building operation everything must be on the spot at the right time. The first thing you need is SERVICE. The finest flooring in the world is of no use if when the men come to lay it you find it is stuck in a freight jam at Norfolk, Virginia.

The right kind of service avoids freight jams. When Uncle Sam was building, he called on us to help keep his lumber cars moving. So we have had a post-graduate course.

Fifty years' experience is at your service when you build, if you see that the lumber comes from LLOYD.

## Proposals

### INVITATIONS FOR PROPOSALS.

**TREASURY DEPARTMENT**, Supervising Architect's Office, Washington, D. C., July 28, 1919.—Sealed proposals will be opened in this office at 3 P. M., August 25, 1919, for furnishing the labor required in the construction complete, with materials that will be furnished by the Government of the United States Post Office Building at Mystic, Conn. Drawings and specifications may be obtained from the custodian of the site at Mystic, Conn., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

**TREASURY DEPARTMENT**, Supervising Architect's Office, Washington, D. C., July 28, 1919.—Sealed proposals will be opened in this office at 3 P. M. August 25, 1919, for furnishing materials for the construction of the

United States Post Office, Mystic, Conn., including materials for concrete, reinforced concrete, stone, granite, brick, structural terra cotta, structural steel, miscellaneous iron and steel work, composition roofing, slate roofing, sheet metal work, skylights, plastering, interior marble, sanitary slate, lumber, millwork, painting, glazing, hardware, plumbing, heating, electric work, etc., in accordance with drawings, specifications and bills of quantities attached thereto, copies of which may be obtained from the custodian at Mystic, Conn., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

## THE ARCHITECT AS A CITIZEN

(Continued from Page 452.)

local organizations in the building trades, men who, notwithstanding the fact that they have been accused of many practices under the term of "unionism," are after all, interested in the safety of those engaged in building construction and in better workmanship and in the improvement of materials.

Now, a practical illustration, it seems to me, of how we are loosing opportunities, was given in Philadelphia where, last week, there was held a so-called "Own Your Home" exhibit. The newspapers stated that there were a hundred thousand people who went to that exhibit, people who were primarily attracted by something which concerned the home. I made it a point to go there and to see what anybody could learn about the services of the architect in connection with the creation of a home.

I asked people strolling about in the aisles where the architectural exhibit might be found, where there was anything there which related to architecture or to "drawings" of houses. Nobody knew. Some of the people did say that they had seen "pictures" of houses and some said that they had seen a model. I was finally directed to the spot and found that it was an exhibition of the Operative Builders' Association of Philadelphia. Scattered about were comfortable chairs, and in the center was a model of a fairly descent looking house; on the walls were water color pictures and photographs of houses. Adjoining this space were one or two booths where there were blue-prints and pictures of houses shown by firms of builders.

Throughout the entire exhibition, at various booths there was literature of different kinds for distribution to those one hundred thousand people. But it was printed matter telling them what to do in the way of securing property, how to finance loans and mortgages, how to insure houses and all that. Everything connected with the purchasing of ground and the erection of houses was apparently

We have pebbles all sizes. Cost less than what you are using. **DAVID FRANCE CO.**, Tasker Street Wharf, Delaware River, Philadelphia.

taken care of, but there was not one thing that would make that one hundred thousand people realize that an architect could or should have anything to do with the improvement of those houses of the people, either as to convenient planning, designing of attractive features or providing sound principles of construction.

It seems to me that we lost a potential opportunity of vast proportions, there alone, to reach one hundred thousand people through acquainting them with some form or other of the architect's service. I mention that instance because there are going to be many more such exhibits and a repetition of such opportunities throughout the country and because there is now before Congress a bill authorizing the Building and Loan Associations of the United States to make their capital more liquid, in order that more people may build homes of their own.

Are we going to lose the opportunity of impressing upon these people and these associations the advantages of the architect's service? (Applause.)

#### NEGROES INTERESTED IN HOUSING

The opening of Truxton, Va., the first town in the United States planned and constructed by the Government for colored persons exclusively, calls attention to a widening interest in the proper housing of the Negro population of the United States. Truxton has 250 houses, each containing five rooms and bath. All modern conveniences are provided and the dwellings are attractive. The town is to be governed by the tenants, who meet with the town manager, a representative of the United States Housing Corporation.

According to reports sent to the United States Department of Labor, Ohio is interested in working out plans to improve the housing conditions which prevail among the colored population. A State-wide plan that will relieve congestion and assure proper housing for thousands is being discussed, and it is possible that a means of financing building on a big scale will be found. Several suggestions have been discussed as practicable. One of these is the organization of a building and loan association by responsible colored men. Such an enterprise would command the support of many large companies that would be interested in aiding the new venture to become firmly established. Another idea is that the Negro insurance company, with which the cooperation of other Negro organizations

would be assured, should make the necessary connections with local building and loan associations.

Since the war many northern cities have had such an increased demand for houses and apartments from colored tenants that in certain communities the congestion has become serious. The urgent need of dwellings that shall be in every way desirable has been emphasized by the fact that there is a steadily increasing number of negroes able to pay for comforts and conveniences as well as for mere shelter and a place to sleep.

#### WALT MASON PRESENTS HOUSING SITUATION

From out West the Curtis companies have sent to the United States Department of Labor a characteristic poem written for their service by Walt Mason. The poem encourages building as follows:

##### HOUSES SCARCE

Oft I hear discordant slogans, hear the loud and sad lament; men are wearing out their brogans hunting houses they can rent. Every village, town, and city sees the same discouraged crew; and it seems to me a pity that good houses are so few.

In my native burg, Empory, I see women chasing round, and they tell the same old story—houses simply can't be found. And the same sad word is spoken everywhere I chance to roam; from Topeka to Hoboken folks are hunting for a home.

When they're sick and tired of chasing, when their souls with woe are filled, maybe they will do some bracing; maybe they'll decide to build. Rents are higher now than ever, and the prices won't slump back, and that man is really clever who will build himself a shack.

"But the cost!" I hear men yawping; and they put up thoughtless roars, for they never have been shopping at the modern lumber stores. Building goods today are cheaper than all other goods you buy; all commodities are steeper—ask the lumber dealer nigh.

Moneyed men are often questing for gold bricks, and dern the price; always ready for investing in blue sky and pickled ice. If they'd build a lot of houses they might dwell in Easy Street, where the catawampus browses, and the dingbat's song is sweet. Every time they'd build a dwelling crowds would come, and still increase, crying, clamoring, and yelling, begging for a five-year lease.

There's no better proposition than this thing of building homes, and the fact

should find position in the plutocratic domes.

And the man with modest bundle should be renting nevermore; he should take his wad and trundle to the lumber dealer's store.

There should be a boom in building such as we have never seen; palaces with ornate gilding, modest homes, all painted green.

\* \* \*

#### CLEVELAND BUILDERS EXCHANGE LARGEST

Cleveland now holds the honor of having the largest Builders' Exchange in the United States. The accession of sixty new firms and companies since the last annual meeting in November has brought about this result. For a number of years there has been a keen rivalry between the exchanges of Detroit and Cleveland as to numerical strength.

A copy of the latest official roster of the Detroit exchange shows that its present membership is 445 while Cleveland now has a few more than 500 firms and companies enrolled on its membership list. San Francisco held this honor during the construction of the world's fair buildings, when a large number of outside contracting and materials firms flocked to that city to obtain a portion of the large volume of building operations.

Arrangements were made for Cleveland's representation to the convention of the Ohio State Builders' Supply Association at a meeting of the local supply dealers held on Wednesday, July 25th, 26th and 27th at Cedar Point. In addition to the consideration of matters connected with the readjustment of conditions following the war in this line of business, a number of social features will characterize the convention. Many of the dealers and their families, especially from the southern and central part of the state, will regard the convention in the nature of a summer outing.—*Cleveland Plain Dealer*.

In the construction of the steel frame for the Statler Hotel at St. Louis, Mo., last year steel erection proceeded at the rate of two stories every 4½ days. The building is 150x130 feet, 20 stories high and contains 4,500 tons of steel, 700 tons of which were used in the basement. A 10-hour shift was worked for the first few weeks. The steel erection was done with two 12-ton guyed derricks.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

Our specialty is Portland Cement that will stick and pass the City Department. **DAVID FRANCE CO.,**  
Tasker Street Wharf, Delaware River, Philadelphia.

## I Want a Home with a Humphrey

"I COULDN'T be content with the old troublesome ways of heating water after seeing how convenient and how positive the Humphrey system of hot water service is."

Nowadays, a home is cozy and comfortable, only if it has a good supply of hot water always ready.

Wise householders are asking for Humphrey gas water heaters. They know they are dependable and economical.

Our builders service sheets in your files will enable you to select the right size and style.

Phone us for these.

## VOGEL

PATENTED

### Frost Proof Closets

Over 350,000 giving satisfaction. Save Water; Require No Pit; Simple in the extreme. The most durable water closet made. In service winter and summer.

Enameled roll flushing rim bowls.

Heavy brass valves.

Strong hard wood seat.

Heavy riveted tank.

Malleable seat castings will not break.

Sold by Jobbers Everywhere

**JOSEPH A. VOGEL CO.**

WILMINGTON, DELAWARE  
ST. LOUIS, MO.

### Brownstone Bricks

2,000,000 at \$16.00 f. o. b. Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

### Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

### Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

### Vitrified Paving Bricks

Standard specification pavers at lowest market price.

## As The Editor Sees It

**N**O topic at present holds more general and vital interest than that of high prices. All discussion relating to when they will come down, how they will come down, or whether they will ever come down is eagerly attended to. In a recent address by Mr. Charles E. Bedaux, of the Charles E. Bedaux Company, Industrial Engineers, delivered by Mr. Bedaux to the Industrial Association of Cleveland, some rather startling new phases of the situation are brought forward and discussed. Mr. Bedaux's viewpoint is original and his answers to the questions he asks are unusual and interesting.

"The high cost of living and high scale of wages—should they remain?" asks Mr. Bedaux. And if not to remain where is to be the change? We contend that the wages, outside of some adjustments, will remain the same. Many manufacturers show today that it is practical to reduce their cost of manufacturing through a reduced cost in labor, through a radical cut because the material still has to be purchased. The fact is not to be forgotten nor overlooked that the producer is essentially the purchaser, and he must buy the goods and they should come down before his wages come down. This is the argument of many. But in the end if the wages are not to come down and the prices have to stay up all around in the selling of the product, what will be our fate in the United States as an industrial nation?

We think that the Europeans have a

reconstruction period which awes and terrifies, but it is in my mind a question whether we have not ourselves a reconstruction period which is as important if not more important. I heard a soldier the other day on the train state that he did not think much about France. He had gone from the ocean to the battle front and he had seen nothing but vineyards and two factories, and those two factories made brandy. But he didn't pass the right way. There are factories today in France that are as large or larger than most of our industrial groups in the United States. One of the large factories of France started a little over four years ago and now employs over forty-five thousand men and women. This factory is supplied with the very best facilities for the welfare of its employes, including dentistry and nurseries for children, as so many married women work there. With the signing of the peace treaty France has more blast furnaces than Germany ever had. France has learned German efficiency through a great deal of sorrow, and is now bent upon turning her new knowledge, with her new facilities, with her new coal deposits from the Saar basin, and the steel from the Briey district, into standardized products, capable of being manufactured and sold in competition with the most advanced American industry.

American efficiency, typically an American institution, is more interesting to England at the present time, it appears,

than it is to this country. Motion studies are actually practiced, and not talked in that country. It is useless to talk of Germany. You have read the peace treaty or, rather, a summary of it, but it must not be forgotten that the Germans remain. They will no longer be taught the goose step, but will continue to follow their industrial organization, which is almost unequalled and will be held by iron discipline which seems to continue even through their revolution. When you consider that those countries manufacture articles at a cost of labor which is two cents where it is three to us in the United States, we wonder where we will sell our goods in five years from now, if we are to utilize that which we have built during this war, to supply Europe and supply our own needs. Thirty-three per cent. difference in the scale of wages is not easily offset and something radical must be done. While a protective tariff may conserve our industries for our own needs, it will not be possible for us to go into South America or to go on European soil in competition with a modern Europe, having new ideals, new methods, taken and learned through study from our American engineers and business men during the war, who have shown them what organization should be. It will not be possible for us to compete with those and we shall either have to stay home or find some other way out.

The question is, what is the way out? We find it through efficiency. What is

efficiency? To many of us it represents a planning department, a planning room that stands in the middle of the shop, or in some corner, with a great deal of importance; and this planning room attempts or claims to attempt to send work through the shop at given times so that it may leave one machine at a certain hour and reach another machine at another hour. I might ask the question: how can I tell how much time it will take me to get home if I don't know the distance, nor the conditions I will be in when I am ready to go home? This information is essential. One has to know exactly what he is going to do before he can expect to plan. This is determined, many will say, by the setting of standards. But, then, how are they set, and how are they used? I have personally gone into many factories, perhaps fifty new ones each year to visit, and twelve each year to work in. Out of the 90 per cent. of planning departments that I have found in those industries I do not believe I have found five per cent. that really have standards of time with which to work. The operator knows that and he is quite keen on his realization and appreciation of the fact. He does not sympathize with the average efficiency movement, because whether the standard is used as a method of remuneration or whether it is used to plan the work through the shop, he loses confidence in the effort that he has made and he turns it more or less into ridicule. I can talk from experience.

However, I came to this country, not very long ago, unable to speak the English language, and you know what is done to the average foreigner when he comes to America without any knowledge of the tongue. I came with a silk hat and a cane, but a very short time afterwards I was a drill hand digging in the tunnel between Long Island and New York. I was, of course, disappointed, and I had expected better things, but they were the very best experience I could possibly have, and they were the means of my holding and doing the work that I am doing today. I believe it should be almost compulsory to expect such training in every efficiency man. I did not jump from the tunnel into the position of efficiency engineer immediately. I had to go through all the various gears of the mill. So I have had the opportunity to learn what a dollar was worth in labor and what it meant to earn it under difficulties, and then afterwards easier conditions. I have worked under efficiency systems, so-called, when I was an operator, so I can fully sympathize with the idea of the workingman who today works with me or with my engineers in my work.

We contend that 33 per cent. of the

cost of labor must be reduced to offset the difference between American and European scale of wages. We cannot expect the European scale of wages to go up immediately, for we first will have to teach the European to use electricity or gas in his home, to take a bath once in a while, to have a telephone to call up market for goods, that sometimes come short, sometimes come good and sometimes come badly. The average European woman goes to market and spends half a day trying to save three cents and walks back with the load so as to save car fare, which is three cents. Here the average wife of the workingman has a telephone and calls to the market, therefore, having less chance of selection. That alone increases the cost of living—the lack of selection, which decreases the quantities received, the lack of specialization in choice, which removes education along that line. So unless we take all that away from the European—the French, the British, the Italian lady—and the many discomforts that her husband accepts after his work, and unless we do away with the millions of women who in Europe today are expert mechanics, having learned through four years of intensive labor—unless we take those away we shall have to find some other means of reducing this 33 per cent. in cost of labor.

It must be through efficiency, and yet it should be through efficiency which is different from the one I just mentioned—the one of setting standards without particular knowledge of them, through practices that operators know and more or less despise. Then how will it be? Will it be through method? And what is method, systems, records in a plant? The first consideration in a factory, you will agree with me, is to have the men happy. If they are not happy you cannot have an efficient production. What is the second consideration? Production—turning out the finished product. It must therefore be realized that any method, any system, must be secondary to production, to manufacture. When it is well determined that production is supreme and that method is secondary to it, and anything other than method has been removed, then that method or system must be followed.

It is unfortunately the case that the practical man finds so often that a portion, and a large one, of that systematic way of routing or carting things through the shop is hampering production, and he therefore sets aside all or a portion of that system. At that time it must be remembered that once it is determined that the method or system adopted is secondary to production and is used to serve it, that system or method must be used as a whole. It is far more injurious

to use a portion of it than not to use it at all.

In the days of our forefathers they had to serve a five-year apprenticeship, and when a person became a master worker the boss knew to a unit just how much he could produce in a day, for all he did was with his hands. Today conditions demand new standards. A machine makes five hundred pieces where a man used to make ten. We soon forgot the fact that a man used to make ten; we only knew that the machine could make a whole lot. But one competitor using the same machinery is getting four hundred, and the other one, having such a combination of machines gets only three hundred and has to pay against his cost a burden on the machinery he had purchased, finds himself out of business, although that machinery manufactures a great deal more than the man by hand used to do. For that reason there is a need of order, there is a need of system and method, but it must remain secondary to the manufacture itself.

There is nothing more detrimental to industry than to see in the shop many colored cards and sheets going all over without any other purpose than to furnish employment to begoggled young men who have not much else of interest. The average man with a white collar when he gets into a factory where it is more or less noisy has only one feeling, and that is to get out. There are many men today who cannot think at all when their hands get dirty. It gives a certain superiority to the shopmen, a superiority which is often distinctly shown. It has a great deal to do with the discredit into which many of the systems fall. Those systems hampering production, causing discontent, should cease to be. It is strange for an efficiency man to come and tell you that those systems should end. They should. If men unfamiliar with manufacture have adopted or presented methods supposedly to help manufacture, and are falling short of their expectations, it becomes the duty of the manufacturing man, or the workingman, to take the place and add to this manufacture whatever means are necessary to make it systematic. To just look at it and say, "It is no good and will not work, and I know it will not work," is no justification. The thing to do is to take it and make it go right. What efficiency needs today is practical men with the knowledge of the shop who will learn the possibilities of improving production and becoming efficiency men themselves and not be afraid of the name, for it is in that way, and only in that way, that we can reduce the cost of production, as we must reduce it within a short time.

The application of efficiency to indus-

try with a view to reducing cost has been largely limited to that—the various means of routing or checking or planning the manufacture of the work through the various shops. It has done so without the fundamental knowledge which is absolutely necessary—measurement, knowing what are the units, if there are any, that can govern the relation of that which has to be done with that which is today the thing that has to be done, that is, planning. Planning is a well-ordained intention of doing one given thing at a given time under given conditions. Now, can we as a rule plan work through manufacture? Have we the information that will make that possible? And when it is done will it give the maximum result, the maximum production for a given effort? We contend it does not. The efficiency man of today, instead of sitting in the office of the planning department or in the executive office, should go through the shop to find out—not for the workmen but with the workmen—how long it takes to do a thing, whatever that thing may be; to agree with them that it does take that long, and once it is determined to put it down into a record that under given circumstances it has taken and it should take that long to perform that given operation, and then pass on to the next operation with that other man and that other machine, and so on through the shop. Take those time studies with the foreman, analyze them with him; take up the question of toolings, if there are any to be taken up, and the question of material being brought or taken away, if it is a matter of arranging work, and then arrive at a knowledge which is essential, which will show three things—the time required to perform, the capacity of that which performs, if it is a machine, and the weaknesses in the performance if it is properly timed.

In the operation it will give an actual time to perform under given conditions. If that actual is then combined to a period of rest, as no human being can be expected to work all day long without any rest, a certain figure will be reached. We will say, for instance, a milling operation—hand mill—and it has taken for that particular job two and a half minutes, but it is agreed by the operator and the foreman that there was a certain waste time, not wasted by the operator necessarily, but wasted through the process, through the nature of the operation, or through conditions of tooling, so that the actual time under normal conditions is two. Then add to that a certain percentage, we will say in this case it is one-half for rest and delays, so that the total will be four. Suppose instead of doing it with one operator you had done that a thousand years ago with a

thousand men, all average men, and had given them a certain operation to perform and had determined the individual time, had taken the waste and combining the time of a thousand and dividing by that number you had arrived at an average time to perform, and you were to repeat that same experiment today with a thousand men, you would arrive at practically the same thing, for individual length of time does not change. I do not speak of equipment; I do not speak of facilities; I speak of time as an average running through the ages. Whatever time you have set, if it is four minutes on that milling operation, and if the metal runs the same, and it is the same metal under the same conditions of light, heat and so forth, whatever time you put it in the future it will require the same time as it does today.

In other words, the standard of time does not change unless the operations or the conditions that govern the operations change themselves. If it does not change, then why not use it as a constant, as a means to measure that which is done? If the efficiency man who himself is a shop man, familiar with the lines he goes into, with the help of the operator and the help of the foreman arrives at an average time to do a certain thing, isn't that a form of measurement? Suppose that you have arrived at four minutes; just to be different call it four points. What is an inch? An inch is a twelfth of a foot. What is a point? We call the point the fraction of a minute of rest, the aggregate of which makes one minute. That becomes a unit, a unit to measure by. And if we were to have today units of measurement on all operations that are performed, we could dispatch the work through the shop. We could remunerate labor without any differences or difficulties, and we could secure an increased production that would probably offset the difference in cost of labor between our allies and friendly competitors of the future.

Some time ago in a shop in Springfield I saw a machine invented by the general superintendent. Speaking of the machine, after we had made some study and determined the number of points ourselves. I made the statement that the maximum production for a human being was twelve hundred, and I was laughed at by the general superintendent, by the president of the concern and by the director of production. We had made a bet and a few weeks ago I received a telegram from Springfield stating I had won my bet, as the total production was twelve hundred and thirty-five. Why? Because it had been a piece-work price in the past. That machine was a special machine and no record of production had been made of it in the past as to its

possibilities. It required an analysis of that particular machine in relation to performance to ascertain just what was its possibilities. The standard in points that I just mentioned a while ago would not have required twelve hundred. Twelve hundred, we stated, was the maximum. The manufacturer stated that eight hundred was a great maximum and that twelve hundred was possible. Now, isn't that repeated a great deal throughout the industries? Isn't there something that is holding back the movement forward of the operator, particularly through piece-work?

## SOMETHING NEW IN

### DOOR CONSTRUCTION

One of the exhibits of the Model Homes Exhibition held at London is a door of novel construction, which has been patented in Great Britain under the name of "The Receivador." The door is a double one, and is constructed with compartments into which tradesmen may insert parcels without disturbing the occupier of the premises. Inside the house another door gives access to the compartments, and the mechanical feature of the contrivance is the alternating interlock, a clever device which makes it mechanically impossible for both the outer and the inner door to be open or unlocked at one and the same time.

When the tradesman, after inserting his package, closes the outer door of the compartment and turns the knob, this action automatically locks the outer door and unlocks the inner door. When the occupier removes the package and closes the inner, the latter in the same manner is locked and the outer door unlocked. The doors and locks are being manufactured in Nottingham and the inventor claims that his idea completely revolutionizes shop-to-home delivery service. The patentee, an American citizen at present residing in Nottingham, has already made application for patent rights in the United States.

\* \* \*

By laying a double course of enameled brick where a porch floor intersects a wall, you make a hit with the housewife. The enameled bricks protect the wall when the porch is scrubbed and are easy to keep clean. Keep these points in mind when building. The evidences of your forethought in these things cannot be hidden and you will soon acquire a valuable reputation as a careful and up-to-date builder.—*Exchange*.

Business is founded on reciprocity and co-operation. Any other plan than this spells bankruptcy. The successful business nowadays has a heart and a soul.

# Use Holt Roof Connections with

## *Barrett Specification Roofs*

TYPE 1

TYPE 3

TYPE 4

TYPE 5

TYPE 6

## Watertight, Flexible, Permanent

Holt Connections are just as permanent as Barrett Specification Roofs. They are made of heavy cast iron, brass and copper and are adaptable to all types of roofing on buildings having interior drainage.

But permanency is not the only factor necessary for the successful roof leader or vent connections.

Holt Connections are positive safeguards against the most severe cases of shrinkage, settlement and vibration in roof or building.

Holt Connections withstand expansion and contraction. Unlike the ordinary metal outlet boxes, quick changes in temperature which affect the leader lines will not push them out of place and thereby cause leakage. The Holt Expansion Joint provides a permanent, flexible water and gastight connection, and permits a range of movement of the leader lines of from 1½ to 3 inches, according to type of connection used, and construction of leader lines and roof decks.

Holt Connections are made in a variety of types and sizes, to meet every need for a high-grade, dependable roof leader, vent, pipe, brace or flag-pole connection.

Even a poor roof is made better by the use of Holt Connections. They have never failed.

## Lumber and Service

In a building operation everything must be on the spot at the right time. The first thing you need is SERVICE. The finest flooring in the world is of no use if when the men come to lay it you find it is stuck in a freight jam at Norfolk, Virginia.

The right kind of service avoids freight jams. When Uncle Sam was building, he called on us to help keep his lumber cars moving. So we have had a post-graduate course.

Fifty years' experience is at your service when you build, if you see that the lumber comes from LLOYD.

### WILLIAM M. LLOYD COMPANY

Established 1868

Lang, 731 Custom House, New York, N. Y., in the discretion of the Supervising Architect, Jas. A. Wetmore, Acting Supervising Architect.

**TREASURY DEPARTMENT,** Supervising Architect's Office, Washington, D. C., July 28, 1919. Sealed Proposals will be opened in this office at 3 P. M., September 10, 1919, for furnishing the labor required in the construction complete, with materials that will be furnished by the Government, of the United States Post Office at Douglas, Ga. Drawings and specifications may be obtained after August 13, 1919, from the Custodian of the site at Douglas, Ga., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

### SILICA SAND FOR BUILDING PURPOSES

The Sidley Silica Sand Company, which owns a large property at Sidley Station, Chester County, Pa., has started operating its plant and is now ready to deliver silica sand in quantities to building operations. The property comprises twenty-three acres of high grade silica rock. The chemical analysis of the sand from this rock shows that it runs well over ninety-eight per cent. pure silica.

The present capacity of the plant is two hundred and fifty tons a day. It is the intention of the company to produce silica sand and rock in various sizes for the building trades, the iron and steel industry, fire brick, abrasive wheel, soap and scouring powder industries, and for any other purposes for which a sand of this description can be used.

The Company maintains its office at 611 Widener Building in the City of Philadelphia, Pennsylvania, and will send samples to any persons interested in testing this sand for their particular uses. Quotations will be submitted on request.

### RUSSIAN LUMBER SITUATION

Last summer the sawmills of Archangel and the White Sea district in Russia were able to produce only about one-fourth of the timber sawn in 1913, and it is extremely doubtful whether the output in 1919 will amount to one-eighth, states a recent report of the U. S. Trade Commissioner at Archangel.

The felling, floating and sawing of lumber are the principal industries of this region. The decrease in production during the war and revolution is directly traceable to labor and kindred troubles, shortage of tonnage and diminished demand from Europe. In spite of the tremendous need of lumber in Western Europe, sales are very difficult, partly because of the Russian insistence upon a low rate of exchange, the present obligatory rate of foreign exchange not representing the true value of the ruble.

## Lumber and Service

In a building operation everything must be on the spot at the right time. The first thing you need is SERVICE. The finest flooring in the world is of no use if when the men come to lay it you find it is stuck in a freight jam at Norfolk, Virginia.

The right kind of service avoids freight jams. When Uncle Sam was building, he called on us to help keep his lumber cars moving. So we have had a post-graduate course.

Fifty years' experience is at your service when you build, if you see that the lumber comes from LLOYD.

## As The Editor Sees It

WE have received a very interesting letter from Mr. D. Knickerbacker Boyd, F. A. I. A., stating very clearly many reasons why architects are qualified to serve in city governments and so forceful are the facts related by Mr. Boyd that we print in full his communication, and strongly indorse his sentiment:

"All the Philadelphia papers," says Mr. Boyd, "contained the announcement last week that George W. Coles, Chairman of the Subcommittee comprising representatives of various independent organizations had selected the New Committee of 100 to name the independent candidates for Mayor and the new small council at the coming election.

"That is very gratifying to the patriotic citizens of Philadelphia who, without partisanship or favor, desire the City's administrators to be severed from politics and selected for eminent qualifications to render practical and unselfish service to the community.

"No exception can be taken to the personnel of the Committee as announced, nor to the statement that 'The Committee is made up of representative men and women from every section of the city. The suggestions of names came from many different sources and every suggestion was given careful consideration. Every man and woman on the Committee was selected because it was believed that he or she reflects the real sentiment of his or her district, and we believe that the personnel is of itself sufficient

guarantee of the patriotism and integrity with which the Committee now will proceed to its business of studying and ultimately recommending available candidates for the offices to be filled this fall.'

"To one accustomed to looking for the names of architects on the lists of committees appointed from time to time for various civic, entertainment, reception or other purposes, of which this is but one, the writer is struck now, as always before, by the almost entire absence of members of this profession—men who have made the city's name in the architectural field of the country synonymous with service and the performance of civic duty.

"The excellent list, as printed, contains the names of seven physicians, seventeen attorneys, four ministers, thirty-nine manufacturers and merchants, seven bankers, three publishers, four labor union representatives, one educator, one realtor, one chemist, three 'retired' two insurance men, three engineers, seven women and one architect.

Do the people of Philadelphia or its choosers of various important committees need to be reminded of what the members of the Philadelphia Chapter of the American Institute of Architects and individual members of the profession have been so energetically and unselfishly doing to advance the City's interest for these many years past?

"I refer now to that part of the architect's service mentioned in the By-Laws of the American Institute as that of ren-

dering 'ever-increasing service to society'—as distinct from what appears to be his more commonly understood service of designing, specifying and supervising the construction of the buildings which line, but unfortunately do not always adorn, the streets and roads of our cities and suburbs.

"Philadelphia has a Chapter of the American Institute of Architects, and individual practitioners most favorably known and highly appreciated the country over. Why should not Philadelphia give this profession and these members greater recognition and greater opportunity for service to their city and their calling?

"In John T. Windrim, the son of James H. Windrim, whose loss was but recently mourned, and who was for a long time Supervising Architect of the U. S. Treasury Department and once Director of Philadelphia's Department of Public Works, we have not only the architect of some of our largest and best buildings, but an excellent executive who has himself been often mentioned as a possibility for Mayor.

"In William D. Hewitt, the designer of the Bourse, the Bellevue-Stratford, and other important buildings, we have a sterling character fit for any public service.

"In Horace Wells Sellers, as Chairman of the Committee which restored Congress Hall to the satisfaction of the city and the country, we have a man of unselfish accomplishment, thoroughly versed in local and national history.

BELL PHONE, WALNUT 1086  
Philadelphia  
KEYSTONE PHONE, RACE 614

**BLUE  
PRINTS**

"John Hall Rankin, whose firm has designed public buildings in various parts of the country, has for years served on our Comprehensive Plans Committee, and was recently the one Architect on the Charter Revision Committee.

"John I. Bright has given years of his time to a comprehensive study of Metropolitan Philadelphia, its traffic and port facilities, as has also Milton B. Medary, who has, in addition, acted as Chairman of the Chapter's Committee on Housing. Until the recent return of Paul P. Cret, another fine example of Philadelphia's architectural genius, Mr. Medary acted in his place on the Art Jury.

"Albert Kelsey, to the first to visualize the Parkway, has also been a constant worker for this City's advancement.

"Edgar V. Seeler, the architect of the Curtis, the Penn Mutual and other buildings, is a conscientious worker anywhere and is a member of the Zoning Commission.

"Charles A. iZegler, who has helped to make Philadelphia's suburbs famous, served long and well on the Congress Hall Committee.

"Horace Trumbauer, too, is responsible for many of our best buildings and maintains a lively interest in our Parkway, Art Gallery and civic embellishment.

"In Clarence C. Zantzinger, we have resident with us a Vice-President of the national organization—the American Institute of Architects—as well as a public-spirited citizen like his other partner, Charles L. Borie, Jr.

"And John P. B. Sinkler, as President of the Philadelphia Chapter, was re-elected because of his unselfish service in the cause of his city.

"These and many more architects who might be mentioned have been constant contributors to the city's welfare in matters of city planning, park and street improvements, better housing, living and sanitary conditions, fire prevention, building law improvements, structural and industrial safety, and all those other phases of the practice of a modern architect, whose training and experience so well qualify him for civic service.

"The selection of Mr. John McArthur Harris, the one architect on the present Committee of One Hundred, is a most appropriate choice, and the seven fine women, a fortuitous step in the right direction.

"Why, the writer again asks, do not Philadelphians take advantage of the service which the architects can render as advisors and active workers for the good of their city, whether on committees for choosing the Mayor and Councils, or for any other worth-while purpose?"

## HOUSING THE HOUSELESS

Starting Right, Planning Well, and Exercising Intelligent and Careful Supervision of all Work Will Do Much To Reduce Costs

BY CHARLES E. WHITE, JR.

Cost of building is higher than it ever was before and yet in many communities there has been more building in June than has been recorded in any previous year. Contractors who haven't done a stitch of work in two years report they are working night and day—working nights figuring jobs and working days building them. The hum of the building industry is continuous and the same hammering and sawing that prevailed in summer days before the war is apparent now.

Somebody is paying the price for building and somebody is getting the money, but who?

Material men claim they are not making a more-than-usual profit; the different trades say they are not getting it; contractors certainly are not participating in undue profits, if we are to judge by the low percentage they are figuring in their bids.

Who gets the money? Somebody gets it, for the owner is certainly paying more for his building than ever before. Probably it is the mechanic who benefits most by the higher cost of building. His wages are much higher in all lines, both in the construction end as well as in the line of production of building materials.

Here is what is happening in most sections of the country. The experiences in one town are pretty much the same in every other. An owner decides to build a home (for it is in housing that there is the most activity just now, as every contractor knows). He has his plans and specifications made and gives them out for bids. Though warned by his architect that prices are high, he has, in his zeal, caused plans to be drawn for a bigger house than he is entitled to for present market prices.

"Make the living room fourteen by twenty-eight," he has told his architect, "with four good-sized bedrooms and a couple of bathrooms on the second floor."

"You can't do it for seven thousand," advises the architect.

"Oh, yes you can," insists the owner, "McAdam is building a seven-thousand-dollar house, and if he can do it, I can" (he guesses).

So plans are drawn for a house with cement foundations, iron columns for supporting the first floor, two big living rooms with a brick fireplace and a good-sized dining room and butler's pantry.

Plumbing is of the best, and electric outlets are scattered liberally throughout the rooms. The roof is shingled with composition shingles and the outside walls are plastered with cement-plaster, rough cast.

To bring the house up to the grade desired by the owner, the architect specifies plate glass in all prominent windows, enameled paint throughout the interior, cement steps at the front and rear entrances, and there are several tile floors, to say nothing of built-in cabinets and bookcases.

What happens when the bid comes in?

Of course the inevitable happens. Bids run all the way from eighty-five hundred to ten thousand dollars, and the owner goes up in the air.

Then there is dickering with the lowest bidder. Every contractor hates to lose a job, so they figure and figure and allow themselves to be squeezed a little here and there, clip their profit a little bit more and finally get down to the owner's figures.

Now comes the tug of war. No builder can possibly make a profit on the job except by the utmost of efficiency. There isn't five dollars leeway one way or the other and if he wants to make even a small profit he must watch the job keenly, and lay out the work for his men so that every particle of waste in either labor or material will be stripped away.

"Many builders will get stung in 1919," prophesied an architect to the writer a few days ago. "In their eagerness to get work they have not only figured low, but at the last minute when the owner wavered between going ahead or quitting, they made a further reduction, and must trust to luck that they will get out of it with a profit."

The owner is up against this proposition: He is confronted with an increased cost of building, from twenty-five to fifty per cent. more than four years ago, but his income has not increased in the same proportion. So, naturally, he dickers with the builders and beats them down as much as possible.

It is the contractor's foreman who can save the day for him. If he has a good foreman who has brains enough to cut out waste, and energy enough to see that all work is done expeditiously and eco-

## An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

## ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

## Proposals

### INVITATIONS FOR PROPOSALS.

**TREASURY DEPARTMENT**, Supervising Architect's Office, Washington, D. C., July 29, 1919. Sealed Proposals will be opened in this office at 3 P. M., August 19, 1919, for water supply connections at the United States Marine Hospital at New York, N. Y. (Stapleton), in accordance with specifications and drawings, copies of which may be had at this office or at the office of the Supervising Chief Engineer, Frank A. Lang, 731 Custom House, New York, N. Y., in the dis-

cretion of the Supervising Architect, Jas. A. Wetmore, Acting Supervising Architect.

**TREASURY DEPARTMENT**, Supervising Architect's Office, Washington, D. C., July 28, 1919. Sealed Proposals will be opened in this office at 3 P. M., September 10, 1919, for furnishing the labor required in the construction complete, with materials that will be furnished by the Government, of the United States Post Office at Douglas, Ga. Drawings and specifications may be obtained after August 13, 1919, from the Custodian of the site at Douglas, Ga., or at this office, in the discretion of the Supervising Architect, Jas. A. Wetmore, Acting Supervising Architect.

## Housing the Houseless.

(Continued from page 484.)

nomically he will get away with the work and make a good profit besides. But if his foreman is not onto his job, if he doesn't handle the man skillfully, or if he cuts up material to waste, dollars will slip away from his boss every day the job goes on and when he gets through he will find, most likely, that he has done all the work for the owner for nothing and made him a present of a few dollars beside.

In building a frame house the contractor should start with the lumber bill as the first place to save a few dollars by extra efficiency. Several busy contractors have made a saving of about fifty dollars on each small house by purchasing lumber in car load lots, delivered close to the building site, where the haul is short. At the same time they have succeeded in getting a better grade of lumber. One contractor I know of not only saved about a hundred dollars in this way, but he received from the owner a bonus besides for furnishing better lumber than the grade specified.

Contractors skillful enough to do it can usually save money by taking off their own lumber bill, instead of leaving it to the lumber dealer. They carefully figure every stick on the job, getting each as nearly the right length as possible, to avoid waste.

Did you ever see a pile of "scrap" lumber left over after a house was built? This is all waste, and the size of the pile determines the skill or lack of skill of the builder. When you see a house framed, however, and only enough scraps left over to build a good fire in the fireplace, it is going some. That builder is a crackerjack. He uses his head and will make a profit sure, if there is any profit in the job.

In spite of high prices the tendency in house building is to maintain the quality. Owners having seen the value of

well-built homes are loath to give up all the comforts they crave in the way of good plumbing and heating, carefully made mill work and a durable job of painting. So the builder is the man who is looked to when the job runs too high. He is expected to save the day by his extraordinary skill in keeping the price as low as possible without lowering the quality.

Hollow tile continues to be a popular material for homes, and builders are getting away with this enduring material at an economical price when architects have brains enough to design their hollow-tile houses with simple walls. Hollow tile can be laid in any fanciful shape, but there is no economy in doing so. For cheapness the sheets of hollow tile should be plain and the less bays and projections on a hollow tile building the more economical it is. The same also applies to hollow concrete blocks.

Usually these houses are plastered on the outside with cement-plaster and this appeals to the owner because a plaster house requires paint only on the trim; so he save enough every time the house is painted to offset the increased cost of plaster.

Brick veneer on hollow tile should be encouraged by builders because it makes a much better house than solid brick and its cost is, to say the least, no more than solid brick. As a matter of fact, in a well managed job, a hollow-tile brick-veneered wall may run less than solid brick in cost.

To save on labor run the face brick up a few courses ahead of the tile backing, and use wall-ties to unite facing and backing. Leave the ties sticking out; as each course of tile comes up to the right height the ties can be bent to catch the course at the right level.

When running a gang of masons, put your best and speediest men on the face work, because, of course, face work goes much slower than the tile backing. The latter fills up the wall quite rapidly owing to the size of the blocks. There is some psychology in keeping the facing well ahead of the backing; the effect of an unbacked wall on the tile layers spurs them on to work faster, so you get up a sort of competition between the front and back of the wall.

Many contractors employ the same men to back up a wall that they use to lay the face brick. This works all right when the men take hold well, but they should lay the back-up tile much faster than they lay face brick, and it is up to your foreman to see that they do.

Of the cheapest and easiest built lintels

We have pebbles all sizes. Cost less than what you are using. **DAVID FRANCE CO.**, Tasker Street Wharf, Delaware River, Philadelphia.

for the windows of a brick house those made of hollow tile, reinforced with concrete and steel rods are probably the most convenient to use. A quick and easy way to make the lintels is to stand a pile of tile on the ground end to end, pier fashion; place reinforcing rods, in what will eventually be the under-cells (when the lintel is in place on the wall), and then fill all the cells with concrete. Usually two rods are used except when the increased span requires more.

After the lintels are set perfectly hard, they are lifted in place on the wall like a slab of stone. This is just rough work but the lintels are excellent and cheap to build; probably cheaper than reinforced concrete lintels because no forms are required.

Often owners who want to save money without hurting the job can be talked into using brick sills in their brick houses, instead of cut-stone sills. Not only is a saving of material made, but often time is conserved when a job is in a hurry and there is no time to wait for cut stone.

In this case it pays to have your laborers pick out the good, straight brick from the pile for sills, and have them delivered on the scaffold right where the sill-builders can pick them up quickly and lay them right in place. It has also been found advantageous to break in one or two bricklayers on sills and let them lay all the sills on the job. There is no particular trick about it, but a man who has had experience in one line of work can usually do it better and faster than any other mechanic.

Considering brick work again, and facework in particular, nothing will lose money for a contractor faster than getting slow men on the corners (leads). No bricklayer in the middle of the wall is going to push the corner men and if the latter slow down the middle men will just naturally go a little slower also. To offset the extra care needed to get corners plumb and level and set the gauge properly for the balance of the wall requires mighty speedy and accurate bricklayers at these vulnerable points. As they have more puttering to do and yet must keep their leads well above the middle of the wall, haste is essential. Accuracy counts tremendously. Laborers should be required to keep the corners liberally supplied with material and your very best men should be given these positions.

When the boss goes on the job and finds several mechanics standing about waiting for others to complete a task or get out of the way, he is sure some-

thing is wrong with the machine. Men don't have to be shoved at top speed all the time to get a good day's work out of them, but they certainly should not be permitted to stand around and wait for anything. No matter what building operation is going on a mechanic standing idle is a mechanic too many on that particular job; he should be transferred to some other part of the work where he will have plenty of room to keep busy.

Lots of money is lost by having too many men on a job. There should be just enough to do the job speedily. Any excess over this is waste. If two men can carry a plank you should not permit four men, and if one man can carry it don't use two.

There are many chances for leaks in house building. Houses are small and the work is more puttering than in commercial buildings, flat buildings or stores. But you must look out and not let your men putter over trivial work. Even though honestly trying to do the job in your interests to best advantage, men often lose time for their employer simply because they don't use their heads.

If you go on a job and find your foreman standing around watching the men work, he isn't the man for the job. A foreman, when he isn't measuring or planning ahead, should be right at work with his men. There is no more important man on the job, and no man who has more to do, or who should keep more busy.—*National Builder*.

People who want to buy things do not catch the seller, chloroform him and cram the orders into his pocket.

Advertising is the proper education of the public as to where the thing can be found, and therefore it is a necessity.

We are parts and particles of each other, but a little of the kindly glue of human brotherhood is needed to fasten us together. The policeman who keeps the crossing clear, and at the same time informs us as to the location of the post office and the First National Bank, no doubt is, in one sense, an economic waste. On the other hand, he is an economic necessity. He is a necessary middleman.

He relieves the congestion of traffic and granting the hypothesis that he does not misdirect us as to the location of the post office, he speeds us on our way.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

## DUCK SHOOTING and COMMON SENSE

When you buy space you buy it with the expectation of getting a reasonable return on your investment. Sure you do. Now where do you stand the best chance of getting that return—in the daily newspaper, whose circulation is confined largely to people with no interest in your product, or in the trade paper, every copy of which goes to a reader directly interested and likely at any minute to need your goods?

If your hobby is large circulation, you will spend your money in the daily—but before you take this step suppose you pause long enough to figure just what percentage of the immense circulation, for which you will pay a fancy rate, is going to go where there is so much as an off-chance of it doing you any real good. FROM THE ANGLE OF THE MAN WHO HAS BUILDING MATERIAL TO SELL, FULLY NINETY PER CENT. OF THE SWOLLEN CIRCULATION OF THE DAILY NEWSPAPER REPRESENTS WASTED AMMUNITION. It is going to readers who are not interested in building material, and are not likely even in a remote sense ever to build or have building done.

IF YOU WANTED TO SHOOT DUCKS YOU WOULD NOT FIRE PROMISCUOUSLY INTO THE AIR, HOPING THAT BY SHEER LUCK SOME MISGUIDED MALLARD MIGHT ACCIDENTALLY WANDER INTO RANGE, OF COURSE YOU WOULDN'T! YOU'D GO WHERE YOU KNEW DUCKS TO BE, and, sighting a covey of 'em, you'd bang away with both barrels. So it is with advertising.

In the daily you stand an off-chance in a thousand of accidentally hitting the eye of some fellow with an interest in your line. In the trade papers, such as the Guide, you bang into a colony of readers who are interested in building above all other human activities.

The moral is—when you go duck shooting do your shooting where you know the ducks to be!

WHEN YOU WANT TO REACH THE ARCHITECT, THE BUILDER, THE BUILDING OWNER, THE INVESTOR, THE SUB-BIDDER, IN EVERY BRANCH OF THE CONSTRUCTION FIELD, THERE IS BUT ONE PRESERVE IN WHICH TO GUN:

## As The Editor Sees It

**F**ORCEFUL and timely are the remarks addressed to us by one of our subscribers, Mr. Frederick E. Mayer of The D'Ascenzo Studios. Mr. Mayer's views on the high cost of living caused by land speculation are commendable and he has very clearly directed attention to a condition in this country which has been lightly touched by the press. As land values are considered carefully before sites are chosen for buildings, we appropriately and cheerfully reproduce Mr. Mayer's letter:  
August 9, 1919.

Editor Builders Guide,  
Perry Building,  
Philadelphia, Pa.

Gentlemen:—

I have just read an article in the BUILDER'S GUIDE, in which you quote resolutions adopted by the Board of Directors of the National Association of Manufacturers, bearing upon the question of "oppressive and economically unjustified living conditions."

We are all anxious to find an immediate, effective and just solution of this grave problem, and much time is being devoted to the public discussion of the question, but nowhere does the writer find reference to the very obvious relation of land speculation to the high cost of living.

Neither in the reports of Congressional activity, nor in the resolutions of business and financial associations, nor in the editorial discussion of the Press, do we find reference to this phase of the prob-

lem. "Profiteers" in commodities are damned from Maine to California, but not one word do we hear of the "profiteer in land, the source from which all commodities must be derived.

In Philadelphia we have witnessed the remarkable spectacle of patriotic citizens being driven from pillar to post, because of the mad scramble for speculative profits in real estate. May I be permitted to state here the self-evident proposition that if all idle building sites and unimproved properties were taxed up to their full rental value, the scramble for more speculative profits would end at once, because it would be unprofitable to hold such realty out of use.

A certain degree of *deflation* would be apparent before many days had elapsed, and the housing problem would soon be in a fair way of adjusting itself to the satisfaction of all but the land speculator.

The architect is ready to design houses, the builder is ready to build, and has the money to back up his enterprise, but the speculator refuses to quit except on his own selfish and prohibitive terms.

It is but a step further to demonstrate that if idle coal lands, timber lands, ore deposits and other natural resources are held out of use, it becomes possible for the profiteer to screw up prices to the limit of endurance.

The writer has always enjoyed your thoughtful articles, and is in thorough accord with your concluding sentence, which reads as follows:

"With labor high, the only way to reduce manufacturing costs is by the further development of machinery and increased efficiency in manufacturing methods."

I would add, however, that in order to retain to all of us the benefits accruing from increased efficiency, it will be necessary to stop land speculation by imposing a tax upon ground rent.

If we do not divert into the public treasury the land values created by all of us, the land monopolist will absorb any benefits that may come through increased efficiency, and conditions are bound to remain unsatisfactory.

Trusting you will find space in your columns for the enclosed, I am

Very truly yours,

FREDERICK E. MAYER.

\* \* \*

Sir Edwin Lutyens, the distinguished British architect, was interviewed recently by the *Cape Town Times*, on subjects which are always vitally interesting to the profession throughout the world. In regard to registration, Sir Edwin is quoted in *The Architect and Engineer* as saying:

"Registration for architects in Cape Town would assuredly toll their knell. They are in no way mobilized," he said, "and are professionally little more than Irish peasants. The Victorian Age and the Ruskin Glossary have destroyed practically all tradition.

"The position of the engineers who are true to their craft and within their

**BLUE  
PRINTS**

craft eschew sentiment, is, as compared with architects, head and shoulders above them in the practical esteem of public opinion.

"Registration can but, at its best, standardize what in reality is worst in our great art. How many living architects are there today who can couple the Doric order *qua* design? Look around your town and see for yourself. I am tired of the excuse: 'You must remember we are in a new country'—just as tired as one gets in an old one of its inversion.

"In a new country you have a new field. You may not have craftsmen, but fine architecture does not depend upon craftsmanship—indispensable to its greatest achievements—but in herself is beyond them all.

"Look at your Dutch Reformed Church in Adderley street, and do not omit to observe the model of the roof construction, and yet Cape Colony was a bit newer even then; or again, in another branch, the pediment and true architectural intention of Groote Constantia.

"When you have educated your patrons by first being educated yourself, it is they that should insist on registration.

"A present-day architect is little more than a tailor—he has to fit his patron, and they refused to register tailors. Norman Shaw's criticism of the R. I. B. A. was that it was an institute of architects and not of architecture. What would be our position as artists when every builder, decorator, plumber, and undertaker is, as he will have to be, registered as a member of the great art of architecture?

"Great architecture is God-given. Do not let us dam any stream that feeds the flow of its possibilities. Don't let hymns and such-like phraseologies ambush your path to honor."

In answer to the second question, Sir Edwin replied that "the only chance for styles was that all architects should work together to one end and purpose. That does not mean that we can make no progress or change, but change must come collectively with a fine collegiate endeavor. Engineers beat us as a whole in efficiency and practice. We come in with an apology for 'art,' which profession is knocked out with the first breath of adornment, whereby we capitulate our sincerity. Americans says, 'Our houses are Queen Anne in front and Mary Ann behind!' A taunt so bitterly true that one despairs. You cannot say that of engineers; they are Mary Ann throughout—honorable, but regrettable. The Frenchman says of the Englishman's work that the buildings reminds him of those warning notices displayed

in public places with regard to gentlemen's dress—this in reference to our national carelessness when we come to plumbing in the area of fine design. We cannot reject the great laws, derived from patient observation, and the works of masters. The suave and rigid beauty of the great Greek, falling to culmination in the Pantheon in Rome, and again in Chatres in France. The beauties of Chatres and of the Pantheon—or the Parthenon—lie not in the type, but in the matter expressed. They illustrate the sincerity of thoroughness in consistent achievement, not mere joy rides in approximating prettinesses: spaces embellished with a fine articulation and without hesitation or stammer.

"In regard to competitions," said Sir Edwin, "men in full practice are generally those who, rightly or wrongly, have earned a certain modicum of public confidence. These are they who will not compete. A young men sometimes gets his chance through this fluke of a competition, and he as often lives to regret

it. The waste of money and endeavor—the hidden client—why not straightway appoint the assessor? The acceptance of competition and its favor depend on the fact that the patrons acting in committee will not take the responsibility of selecting one man to deal with—as each individual member, as a gentleman, would in private life. In America the Institute describes it in their first axiom as unsatisfactory.

"The competition method exists because the older men—secure in their profession—are not generous enough in acclaiming the merit of their younger brothers. Aggrandisement and wealth are held in greater veneration than the future of the art they profess. The whole world is eccentric and requires conversion. Registration won't do this, I assure you. It is not fundamental enough; it is of the same seed as that which produces Bolshevism in labor. Competition among architects is a child born of distrust out of failure. Avoid it if you would have great architecture."

## MAKING HOTELS AND HOSPITALS QUIET PLACES

The patent office at Washington recently issued a patent to Mr. Hiram Percy Maxim, inventor of the Maxim silencer, on a noiseless hotel and hospital. The silencing method appears to be new and different from that used in the well-known silencer for guns. A "silencer" is utilized, however, and it is located upon the roof of the building to be made noiseless. The inventor claims it will cool silenced air in the summer, heat it in winter and free it from impurities.

The idea seems to be to modify from a noise standpoint the air entering the rooms of a building, just as the air entering rooms in the winter time is modified from a temperature standpoint, so as to make things comfortably warm. In the new patent hotel and hospital windows would be used for providing light and outlook only, while ventilation would be obtained from intakes much the same as windows, only being located in the blank partition walls.

In explaining the silencer, Mr. Maxim said that it consists of a number of annular compartments which provide a series of circular, endless passages, so that any sound waves entering become multiplied to an extent which brings them above the frequency of audible sound. In addition there is a non-reflective substance intended to quench all small noise vibrations which may be transmitted through the body of the silencing chambers. This construction is about the size

of a hogshead, and is put in place on the roof of the building which is to be made noiseless. The silencer will be made of sheet iron.

An improvement claimed for the new arrangement is that whereas windows opening upon most streets cannot avoid admitting dirt, dust and smoke and all manner of impurities along with the air, in the new construction, air admitted through the silencer located upon the roof and fitted with dirt collecting and cleansing devices, would be both pure and noiseless. The patent includes a method of cooling the silencer air in summer as well as heating it in winter. The cool and quiet hotel room in August in the cities, heretofore a dream of the future, may be an accomplished fact in a year or two if this latest Maxim invention works out in practice.

The new silencer cannot be made use of in existing buildings without serious modifications, because the ventilator ducts in the walls would be difficult to install. The chief use is expected to be in new hotels, hospitals and apartments where the desire is to supply every luxury that modern facilities can furnish. In hospitals in the large cities, where street noises are the source of added suffering and where they cannot be avoided, the new invention is thought to offer great improvement.—*The Architect and Engineer.*

## Proposals

### INVITATIONS FOR PROPOSALS.

**TREASURY DEPARTMENT**, Supervising Architect's Office, Washington, D. C., August 15, 1919.—Sealed proposals will be opened in this office at 3 P. M., September 26, 1919, for the remodeling of the United States custom house and post office at Providence, R. I. Drawings and specifications may be obtained from the custodian at Providence, R. I., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

**TREASURY DEPARTMENT**, Supervising Architect's Office, Washington, D. C., August 15, 1919.—Sealed proposals will be opened in this office at 3 P. M., September 22, 1919, for furnishing the labor required in the construction complete, with materials that will be furnished by the Government, of the United States Post Office Building at Charlestown, W. Va. Drawings and specifications may be obtained after August 29, 1919, from the custodian of the site at Charlestown, W. Va., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

**TREASURY DEPARTMENT**, Supervising Architect's Office, Washington, D. C., August 15, 1919.—Sealed proposals will be opened in this office at 3 P. M., September 15, 1919, for the construction (except mechanical equipment) of a kitchen and mess hall for the United States Marine Hospital at New York, N. Y. (Stapleton). Drawings and specifications may be obtained from the Supervising Chief Engineer, Room 731, United States Custom House, New York, N. Y., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

People who want to buy things do not catch the seller, chloroform him and cram the orders into his pocket.

Advertising is the proper education of the public as to where the thing can be found, and therefore it is a necessity.

We are parts and particles of each other, but a little of the kindly glue of human brotherhood is needed to fasten us together. The policeman who keeps the crossing clear, and at the same time informs us as to the location of the post office and the First National Bank, no doubt is, in one sense, an economic waste. On the other hand, he is an economic necessity. He is a necessary middleman.

He relieves the congestion of traffic and granting the hypothesis that he does not misdirect us as to the location of the post office, he speeds us on our way.

## What Builders Need

In their advertising merchants are apt to talk about goods—but listen to their *customers*, and nine times out of ten you will find that they are talking about *service*. It's the great force of modern business.

Lumber sold by different dealers is very much alike; but there is a great difference in *service*.

The best service you can get is none too good. When you build that new factory or store, the important thing is to choose the lumber dealer that will give you the prompt, efficient *service* that to builders so often makes the difference between failure and success.

Some day you will build. If you want the work finished on time, see that the lumber comes from LLOYD.

## PAINTING AS AN ASSET

Preservation, Beauty and Sanitation.

By DIXY WELLS,

A greater interest in paint and painting is being evidenced each day, and those interested in the merchandising of the decorative idea are selling painting rather than paint.

Of course, building managers, property owners, etc., actually buy cans or barrels of paint or varnish, selecting from the great array of colors shown on the average chart, and buy an old color without definite recommendations for service, and as a rule purchase at the lowest price—or perhaps some advertising has made a definite mental impression which predisposes the buyer in favor of certain trade-mark materials, but there is much more to painting than there is to paint.

Paint is merely a means to an end. The end is definite and constructive, and when properly applied saves millions of dollars, eases the nerves, protects the eyes and generally builds up the health of those who live within the painted walls.

A good paint salesman will sell the painting idea, will sell the service and the advantages which proper paint supplies. There is a definite distinction, you will see. Proper painting, varnishing, enameling, etc., will help to keep your tenants healthy.

Proper finishes, furthermore, preserve wood. Tests have shown that a floor which has been properly varnished from time to time lasts six and one-half times as long as flooring which is left unprotected. The same applies to the trim in buildings. You know how it is if a bit of plaster is chipped out, and it does not receive proper attention, soon the cracks lengthen and spread. Before long a big piece of the plaster falls down, entailing expense which could have been avoided.

You know the old saying, "A-stitch in time saves nine."

Rents can be substantially increased if rooms are properly decorated. Select a house, for instance, which is shabby and unkept and try to find a buyer. After an investigation people will refuse to buy—they are not sold through the sense of sight—they see the old, run-down place and refuse to purchase. Let this house be properly painted, the yard cleaned up, interior walls papered or calcimined, floors gone over, etc., and thou-

sands of dollars can be added to the sale price, a figure gained entirely out of proportion to the small expense of painting and decorating.

It is the same with building managers, who sell largely through this sense of sight. Convenience of arrangement, location, etc., are important factors, but the first impression has a powerful effect. A prospective tenant, run down at the heel, with clothes out of press, soiled linen and battered hat would undoubtedly be turned down by the manager of a first-class looking building merely on appearances, and the first impression is that he would not be a desirable tenant.

Tenants purchase space much on the same basis.

The best paints in these days have a sanitary feature which is not to be overlooked. There are certain wall finishes which contain an odorless disinfectant which is death to the average germ—that is, if they are stirred up in the dust or are in the air they immediately die upon coming in contact with the wall finish.

There are certain varnishes, gloss enamels, etc., tending to shed the dirt, and are easily washed. This factor is an aid in keeping rooms in a sanitary condition. One may enter a building and at first glance consider it clean and sanitary. But a little cleaner applied to a door reveals dirt and dust—both unsanitary.

It is well, therefore, to use finishes which can be easily cleaned. This saves the recurrent expense of frequent redecorating and gives a periodical freshness to offices.

In these days when soft coal is being burned in many cities, the windows in office buildings must be raised frequently for air; dust and dirt in quantity are carried in, and it is practically impossible to keep rooms clean at all times. However, proper paint and an adequate system of cleaning will greatly help.

The "looks" of a building is important because, as mentioned above, it makes its first and strongest appeal through the sense of sight, and practically everything is sold through the five senses—the sense of taste, smell, touch, sight, hearing—each one applying in a greater or less degree in accordance with the article in question.—*Building Management.*

## The Page "Ad"

"I like the clean, outstanding appeal of the page ad," said an advertiser recently," but I'll be frank to say that I've never been able to convince myself that it can be made to pay."

"Have you ever tried out a whole page?" he was asked.

No. He hadn't. But he knew what a page of space would cost, and he couldn't get away from a certain overhang of doubt that the additional results would prove commensurate with the extra outlay.

We mentioned Wanamaker, who uses a page a day regularly, varying this program now and then by making it two pages.

Oh, yes, of course. But then Wanamaker's case was quite different.

We asked him to point out "how" and "why."

The truth of the matter is that the page ad is just as much more effective than the small ad as the big show window is more effective than the small show window.

To be sure, in the case both of the ad and the window a whole lot necessarily depends on just what you put into them and how you dress it up.

It wouldn't be good business to buy a page of space in order to work off a string of poor sales-talk.

But, assuming that the sales-talk is "right" and the article it is designed to sell an article that has real merit and utility, the page ad is actually the short cut to results.

The first object of any ad is to get the attention of the reader.

Nothing does this more effectually than the page announcement.

We have in mind an advertiser who slips a page space into his regular schedule now and then just as an interest-reviver.

He tells us it pays big.

Whether it would pay as handsomely in **your** case, we are not in a position to say.

Why not try it out?

The cost is not excessive.

Call Mr. L. S. DeLone.

## As The Editor Sees It

THE construction industry has showed to advantage in cost and price investigation and has maintained clean hands and public confidence. Public elements in construction industry have rendered valuable service in advancing standards. Profiteering is the exception rather than the rule in current building activities, says the *American Contractor*, which continues:

"It must be a source of gratification to every man who would see the construction industry continue in America under the unrestrained initiative which, to date, has developed it, that charges of general profiteering in the days of a nation's necessities have not been directed toward it. It surely is the prudent business policy for every man in the industry to do his utmost to keep it above suspicion. The one and only way to prevent government control or government competition is to continue to render such service as leaves the general public satisfied that reasonable effort is being made to render maximum service at minimum costs.

"It is only when an investigation develops something rotten that wide publicity is given it. It is only when your neighbor beats his wife that the back fence gossip gets busy. Virtue may be its own reward, but it gets little if any publicity. The construction industry of the United States has been much investigated since January 1, 1919, and in no instance has there been discovered the sort of material which newspapers like to spread over their first page. The in-

dustry shows up with clean hands. It has not surrendered to the temptation to get all it can get while the getting is good. Construction costs did not go up in proportion to living costs. More construction can be bought today for a given amount of money than that amount will buy in any other field.

"This is a most striking fact when one considers the embarrassments under which the construction industry and building material manufacturers labored during the war. The public should be reminded of the industry's war sacrifices whenever the matter of prices is under discussion.

"Early in the war came the priority order of the shipping board whereby transportation facilities were withheld from building materials so long as these facilities were held to be essential in other fields. Later came the supervision of investments in building through the War Industries Board whereby it was all but impossible for a builder to obtain permission to finance a major building operation.

In February, 1918, came the fuel administration limiting the fuel supply of the window glass manufacturers to 50 per cent. of their normal demand. Then came that fateful April 13, 1918, when the fuel requirements of common building brick, face brick, paving brick and block, roofing tile, floor and wall tile were cut to 50 per cent. of normal; hollow tile and fire proofing, sewer pipe, drain tile and flue lining, on the same day,

were limited to 75 per cent. of normal fuel requirements. Later, cement manufacturers were cut to 75 per cent in their fuel supply.

"During December, 1917, January and February, 1918, throughout the central west and along the Atlantic seaboard there was no possibility of obtaining transportation for building materials other than those shipped to government orders.

"It is a waste of time now to debate the prudence of these policies. The hard fact is that these restrictive actions were taken and the production of building materials reduced from 25 to 50 per cent., and of this materially decreased supply the government diverted great quantities. Stocks everywhere were depleted. Producing organizations were disorganized.

"In November the armistice was signed. After a year of almost complete suspension of building activities it was inescapable that the building demand should be the greatest in history. But in the months prior to the armistice all building material production had been reduced. We had then a situation in which an unprecedented demand was set over against an unprecedented material shortage. The logic of that situation was unprecedented high prices, even if no unfavorable factors were in the equation.

Yet building construction costs did not advance as rapidly or as far as did food costs. The production of food was stimulated throughout the war. Food producers were favored on every occasion.

**DRAWING  
MATERIALS**

**CHARLES H. ROBBINS, JR.**

1209 Arch Street,  
BELL PHONE, WALNUT 1086

Philadelphia  
KEYSTONE PHONE, RACE 614

**BLUE  
PRINTS**

We produced more food than ever before. The food supply was increased and at the same time by voluntary economies and forced conservation food consumption in the United States was cut down. The Federal Trade Commission shows that the storage houses in America had unheard of supplies on hand at the signing of the armistice. With an unprecedented supply of food on hand and only a normal demand, the logic of the situation, if no other facts were in the equation, would be falling prices. But prices did not fall. They have advanced so unreasonably that the public's suspicion has been aroused.

"The public and every person interested in the construction industry at this time should review some of the history of investigations in the latter field since the armistice. Probably the most complete was that undertaken by the Department of Labor early in January when it interested itself in stimulating building and construction work. Its first move was to gather a force of economists, trained in market investigating, and put them to work gathering from every nook and corner information on prices, stocks, market conditions, future prospects, and financial conditions.

"Late in February the Division of Public Works and Construction Developments in the Department of Labor, which made this investigation, began to say in the material released to the newspapers that investigations indicated construction costs and building material prices were relatively low, and, perhaps, the tendency of future prices would be upward. As the investigations were continued and evidence piled up, this statement of trend became more pronounced and in March, even in the face of the general popular belief that construction costs would come down, from the Department of Labor came the positive assurance that construction costs were far below other commodity costs and that the dollar would buy more structural products than it would buy in other commodities. At that time, also, it was announced that the price trend was up rather than down and instead of lower prices the future would bring higher prices. Subsequent events verified and justified those predictions.

"Following this investigation by the federal authorities other investigations were undertaken by state authorities. The State of Illinois made a thorough investigation of construction costs through a legislative committee. Here again the evidence brought the verdict that construction costs were lower than the general level of prices; that the future would see advances and that there was no reason why building activities and construction work should be longer delayed. Both the City of New York and State of New

York went in for an investigation. Out of these latter came a condemnation of rent profiteering, but at no place in the proceedings can you find evidence suggesting general profiteering in the building and construction field.

"The newspapers have not appeared with flaring headlines announcing 'No Profiteering in the Building and Construction Industry.' No one expects them to so appear. And yet it is just as vital to the country that a great industry is playing fair and holding to legitimate charges in days like these as is the fact that meat packers and millers are charging what appear to be excessive and profiteering prices.

"But virtue is its own reward. In this instance the reward has been the absence of anything like a concerted movement for government regulation of the industry and the popular lack of interest in those plans for federal housing activities which have been suggested.

"The public appears to take this attitude. Why interfere with this construction industry when it is rendering reasonably efficient service and charging less for that service, relatively, than other industries are charging for their services?

"Why has the construction industry kept close to legitimate and ethical standards? The public may not be interested in this question, but it is worth while for those of us who are a part of the great industrial fabric. Is it because of the professional elements which profoundly influence policies in the construction industry? The engineers and architects, in maintaining professional standards, have rendered the industry a most valuable service. President Thomas R. Kimball's address before the American Institute of Architects' convention at Nashville, D. Knickerbacker Boyd's address on 'The Architect as a Citizen' in the same convention; President Fayette S. Curtis' address in the Minneapolis convention of the American Society of Civil Engineers—these are examples of the gospel of service preached day in and day out in the construction industry by men who are not prone to hold profits above service, and we cannot fairly withhold from these professional elements much credit for keeping up the standards in the construction industry. The vision of those who are directing the policies of the National Federation of Construction Industries and the Associated General Contractors of America, also has been and is an important and helpful factor.

"This is the idealism which, in the long run, pays a very handsome dividend. First it inspires an honest service. An honest service and a job well done inspire public confidence. Public confidence is the chief asset of every industry. When

public confidence is dissipated government interference is inevitable.

"Thus far our hands are clean. It is purely a prudent business policy—leaving out of the question the matter of self-respect—that we do not stain with the blood money of profiteering the hands to which the people have entrusted the task of building the nation's homes."

\* \* \*

Master Builders' Exchange modifies resolution made in February regarding no changes in wages and has sent the following letter, dated August 14, 1919, to all its members:

"Your attention is called to the following resolution adopted by the Advisory Board of the Exchange:

"Whereas, the February resolution regarding no changes in wages in building work was modified at the request of labor interests so far as to permit new wage agreements to be made governing work for 1919, it is therefore

Resolved by the Advisory Board of the Master Builders' Exchange that such agreements having been made and put into effect shall be observed to date of their termination by every member of each Association constituting the Advisory Board of the Master Builders' Exchange, and be it further

Resolved, that this resolution shall be given the widest possible publicity."

Very truly yours,

WM. H. BARRETT,

Secretary.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

**Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.**

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

# Advance Construction News

CONTEMPLATED CONSTRUCTION: ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

## Plans or No Plans

There are two classes of builders who need the help of a strong, modern lumber centre,—those who have planned their operations well, and those who haven't.

If you have planned well, you will need a strong organization to help carry out your plans. The best is none too good. In big building operations, all of our experience and resources, including the powerful aid of our Traffic Department, are constantly required.

But if you have *not* been able to make careful plans; if you are forced to build hastily and under pressure, then only an uncommonly strong organization will enable you to accomplish your purpose. When you need unusual stocks or service that you have no right to expect, then the resources of the LLOYD organization will often save the day for you.

Some day you'll build. If you want the work finished on time, see that the lumber comes from LLOYD.

## An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

## ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates. Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

# HUMPHREY

AUTOMATIC GAS WATER HEATER

At one-tenth cent per gallon you get hot water in unlimited quantities. Installation of our water heater means the utmost in convenience and economy to the owner.

That means the utmost in reputation and prestige for the architect or builder who installs Humphrey Heaters.

## GARFIELD W. DAVIS

18 S. 7th STREET, PHILADELPHIA

## It is not uncommon

to have a manufacturer call us into consultation and request that we give their *water supply system* a complete overhauling. "Find the trouble," they say, "for as the thing now stands, our production schedule is handicapped by insufficient water supply."

Most often we find the trouble with the system is that some inexperienced person made a miscalculation. Usually he lacked the broad experience and technical knowledge necessary to get a maximum volume at the smallest cost possible to maintain this volume consistently and efficiently.
